Christopher, was not much compared to his title of architect of St. Paul's. But the merits of a teacher were unknown to the world at large; and it was these unknown teachers who were rather the men to be encouraged with honours. He had seen work of pupils of the late Mr. Street. That master inspired life in their works because it was the touch of an artist touching another. Had Street lived, and his pupils taken prizes year after year, even if he had been professionally an unfortunate man, still he would have been pointed to as a man of the highest talent, and as one who was doing a great work. Mr. Harvey said that having seen how they worked in Germany, in France, and in London, he preferred the London system; for it was left to the pupil's initiative to learn, and the pupil learnt in a totally different way from that of a pupil at a desk. Here also were the architectural newspapers, architectural societies, all means of learning for one who had the will to learn. He did not think the new system in Paris, started by M. Guillaume, would succeed. It had killed the *ateliers*, and the *ateliers* in Paris were simply the development of what we had in London, only, where an architect had fifty or sixty pupils, they could not all be in the office, so other accommodation was provided for them, and became in fact the *atelier*. This *atelier* started, pupils came to take a pride in their master, just as pupils here were proud of having been in the offices of Street or Scott.

Professor KERR said that it was a remarkable thing when one contemplated the extremely delicate organisation devoted to the study of architecture in France and Germany, that, without anything of the sort, English students seemed to find their way to design in their own fashion with great success. We had no school of architecture except the Royal Academy. The South Kensington school was, as far as he was told, simply a disgrace to the Government, and the money spent on it shamefully wasted; whereas by dismissing the soldiers, and by admitting the architects, it might, no doubt, be made of great assistance to that greatest of all arts, the art which they, as architects, represented. The way students, and students of high class, attained their knowledge of design was very simple. Professor Kerr described how the student went about it, a method resulting from a different line, and a more directly English line, being taken in a commercial country, where youths could not be persuaded to devote so many years of life to what was called academical study as was done in France, and who had to begin business earlier, and keep to business however sublimated his ideas might be as to art. Professor Kerr went on to say that the premium system was not so much in vogue nowadays, and how he remembered an architect of high repute, Mr. John Shaw, who had made it a rule never to take a penny with a pupil, and, when they showed sufficient ability, he even paid them for their services. Mr. Kerr also noticed what he called a peculiarity of English architectural education, as seen in the illustrations of the professional journals, though he feared these journals were competing with one another rather unnecessarily as regarded quantity. He would rather see more in the way of quality. This peculiarly English institution of the illustration of actual building operations, given in the papers week by week, was one which could not be considered of too great importance. From these illustrations, which were facsimiles of architects' own drawings, students were able to obtain information, instruction, advice, direction—call it what they pleased—to a much greater extent than they could from any school or schools. Therefore, he thought the journals were entitled to be called the academical schools of the country, and that the profession ought to be by no means stingy in support and acknowledgment of those whose commercial enterprise was in question, and of the great service that enterprise was doing for the education of the profession. Mr. Kerr next spoke of Mr. Phené Spiers's school. It was a very admirable school, wherein students were taken through a regular course of study, and he said he would like to see similar schools established at the Institute and at South Kensington. There was no fear of overdoing the academical education of our students, and he should not be sorry to see a rivalry spring up between the different schools. As it was, the English student educated himself in a way that must be called rough-and-ready, and failed in that delicacy and finish common to the French student for want of this academical training. Professor Kerr concluded his remarks by saying that if in England we were allowed to continue to pursue our own course without advice from abroad, which he was sure we should not accept, if we were sensible enough to follow our own way, he was prepared to expect to find England at the head of all architectural schools. There was something promising now in the highest degree, and no one could look back on the last thirty or forty years without being satisfied that we were pursuing a course which must land us in an ascendancy of some sort.

Mr. R. K. FREEMAN, of Bolton, alluded to the separation that seemed to exist too often between the theoretical and practical part of the profession: for instance, there were any number of good draughtsmen, but few who combined good draughtsmanship with a practical knowledge of carrying out a good building. From time to time letters had appeared in the papers about the hardships assistants had in getting a good place. His idea was that a good man could always obtain a good place, and he thought the writers would have done better, instead of writing letters, to have spent

the time in finding out their own deficiencies. Any scheme of architectural education, having London for its centre, ought to have such appliances in the provinces as would bring its advantages within the reach of students in all parts of England. People had to think twice before they left any particular locality to spend eight years in study elsewhere, as they did in Germany. To do so would be a serious drawback to many, as it would involve the loss of connection, &c.

Mr. W. H. WHITE said, in reference to coupling the name of a master with that of his pupil, that some years ago he used to send drawings to the Paris Salon, and once sent in a drawing without the name of his master. He then wrote saying that his master was in London, and the name was put in the catalogue.

Mr. GRUNING proposed a vote of thanks to Mr. Spiers for his paper. It was a pity, he said, that more of the senior members had not been present to profit by the advice given them as to forwarding the education of their pupils. He spoke of the benefits to be obtained in the Royal Academy School. The value of the Architectural Association, he said, was almost equally great, as he could see every day in his own office.

Mr. BRUTON, Oxford, seconded the vote. A pupil in the office of a provincial architect, he said, could not have the same advantages as a pupil in a London office. He only wished some means could be devised for pupils in the country to have some such advantages as could be had in the London schools.

Mr. WOODWARD, speaking of illustrations in the newspapers, said that with so many they were not able to give the attention to any that they deserved.

Mr. BLAGROVE said he thought there might be an objection to students giving the names of their so-called masters. Often when a pupil did get on, he got on in spite of his master. The seniors, he thought, had shown good taste in being absent from the meeting.

Mr. SLATER said that an English student had not the same means of getting the instruction, not alone in design, construction, &c., but in the concomitant subjects allied to architecture, as they had in foreign schools. Notwithstanding all that Professor Kerr had said of the beauty of our designs as exhibited, or as seen in sketch-books and newspapers, no doubt they were beautiful, but were they architecture? A good man would get on in this country, no doubt, in spite of everything, but it took him a great deal longer time to obtain his knowledge than it would had he the use of such schools as they had abroad. Some incentive should be given to induce students to acquire a knowledge of languages, in addition to their own tongue. It would open the information of valuable works which otherwise were sealed books to them.

Mr. HUGH McLACHLAN said that in England a student might learn nearly everything if he only knew how to go about it. The majority of students went into architects' offices, but, as no one pointed out the way to them, they floundered on as best they could, and the result was that the greater number of the buildings carried out in England were a disgrace to the country.

Mr. ALDRIDGE (Liverpool) said the word "system" struck him at the outset. There was a system of education in France and a system in Germany, but he was afraid there was very little system in England. That, as to this country, was, he thought, its initial error, and a grave one. England had produced great architects, but it was in spite of her difficulties. It was not very easy to say how the matter was to be improved. He would be glad if the system of pupilage were abolished, but one could not abolish it without something to take its place. Fathers and guardians had an idea that their sons or wards, having been articled in an architect's office, would at the end of three years come out finished practitioners, having only to put a brass plate on their door, and begin practice at once. It affected not only the parents, but the pupils themselves, to the extent that they could not be got to attend lectures and classes after office hours, as they would do if they knew they had an examination before them. He had taken a good deal of interest in the Liverpool Architectural Association, and established classes which were fairly successful; a series of lectures which had been started had, however, to be abandoned or given to almost empty benches.

Herr FRANZ BALTZER, Berlin, said that the Government were about to establish an institute of master *ateliers* in connection with the Berlin Royal Academy of Arts.

The CHAIRMAN then put the vote of thanks, which was carried.

Mr. SPIERS made reply, and in the course of it said he was not at all willing to be content with the present state of our own architectural education, as he was convinced that we had a great deal yet to learn from French and German schools. The object of the South Kensington school was not to train artists, but masters of schools, and it would take many years before they could arrive at any other result. His experience in the matter of pupils was that country pupils, especially pupils from Scotland, came up better trained than London pupils. Only one of the speakers had referred to the importance of a student having some training to enable him to make proper use of opportunities offered in an office. For this training Mr. Spiers recommended King's College and the London University College, where just the class of instruction as would be obtained in a German gymnasium was to be had. Pupils often failed to get out of their masters all they were

entitled to. As pupils—and this ought to be more generally known—they had the right to copy all his designs, specifications, &c. When once a pupil became an assistant he had no right to copy his master's work.

A visit was paid in the afternoon to the workshops of Messrs. William Cubitt & Co., Gray's Inn Road.—The concluding meeting was held at 8 P.M., when Mr. Cole A. Adams, President of the Architectural Association, took the chair.

The CHAIRMAN said, following a precedent usual at the Conference, it had been decided to hold a meeting especially dedicated, if he might use the term, to the Architectural Association, and to that fact he owed the honour of being in the chair that evening. He would only be expressing the sentiments of every member of the Association in saying that the more a feeling of cordiality was cultivated between the senior and the junior society the better it would be for both. The position the Association held to its Alma Mater was one that admitted of no feeling of jealousy or rivalry. He hoped that the connection which had existed between the two bodies for more than thirty years would be kept up by the members of the Association continuing to pass into the ranks of the Institute.

The SECRETARY announced that letters had been received from the hon. sec. of the Société Centrale des Architectes at Paris, expressing his regret at being unable to be present as the representative of the Society at the Conference; from M. Bailly, one of the oldest and most respected French architects, who was obliged, as President of the Council for hanging the Salon pictures, to remain in Paris. Letters were received also from M. Garnier and others.

Mr. MAC VICAR ANDERSON said he wished on his own part, and that of his colleagues on the Council of the Institute, to express their pleasure in having their friend, Mr. Cole Adams, the President of the Architectural Association, in the chair at the concluding meeting of the Conference, and their pleasure also that Mr. Adams had been elected to serve on the Council of the Institute. He had also to express their gratification at the presence of their professional brothers from the provinces. The more they could do to promote feelings of harmony amongst themselves and their country brethren the better it would be for the profession throughout the United Kingdom.

#### English Architecture Thirty Years Hence.

Professor KERR: The question I am requested to submit to your consideration is one that has a certain particular and practical importance just now—What is the line upon which the profession of architects is moving in England? In other words, what is likely to be the position of English architects, say, thirty years hence? I am expected to confine your attention to the artistic aspect of the question, but to regard it in a practical light.

Now we pretty well understand in these scientific days that all continuous enterprises of human industry or skill, or of social or intellectual activity, when looked at in any degree under the surface of affairs, are found to be subject to the government of certain laws of progression; so that it is the critical study of the past that becomes the only means of forecasting the future. In the arts more particularly is the fact forced upon the notice of thoughtful observers that there has been a continuous current of development gliding through all the ages in one grand inevitable course: now in the sunshine, now in the shade; here swift and strong, there feeble and sluggish; but always the same; the same springs, the same issue; great men and great successes—and great failures with them—being but the greater bubbles on the surface of events, and even the humblest of workers adding every one his indispensable contribution to the tide.

#### *Architecture as an Art.*

Amongst the arts of which I venture to speak in this high tone I may at once say that I regard architecture as one of the very greatest—perhaps, indeed, beyond dispute, the most subtle and most glorious of all. It is nothing to me, standing before an assembly like this, if I should be told to moderate my language, and to ask you to veil your faces before the painter or the poet. I do nothing of the kind. I ask you, rather, to look back along an expanse of magnificent building, whose length is not to be measured by furlongs and feet, or its area by acres, but its unbroken continuity by the very ages of history, throughout at least five thousand years of time, and in whose earliest and crudest works, such is the inherent majesty of the art, Queen of the Arts, the noblest of mankind aimed at never less than the noblest homage to the noblest conceptions of the Divine.

Along this splendid line of artistic manifestation we see exemplified, more clearly than in almost anything else that philosophy can quote, the operation of the process now known by the name of evolution. The simplicity of it is indeed perfect. Given the desire to build in beauty—nothing more—and the whole scheme of architectural history throughout the past is understood; and the persistent sequence of the self-same scheme throughout the future too. Out of the desire there comes at once a continual endeavour after novelty, the diversity which supplies the material for selection. That which is worthy is reproduced; that which is not is not; and hence arise schools and styles, in the most direct and palpable

form, by the survival of the fittest. Thus it is that the study, the very studentship, of this art becomes so essentially bound up in the past; for no training worthy of the name can stop short of a review of the whole historical scheme of development. And thus it is again that the progress of change in this art appears to be so slow, the limits of even the most eager originality so narrow, and the disappointment of the too ambitious so complete.

Therefore, if we would try to understand our own position just now as representatives for the moment of this great art in England, and to foresee the attitude of our order in the next generation, the easiest mode of procedure—perhaps the only one—is to begin a generation back, and so work forward to the present day, in the hope that our research may acquire momentum enough to carry us still forward a little way into the future.

About fifty years ago, then, there happened certain occurrences which make the period a great landmark in English architectural history. In 1834 there was founded our professional guild, now so well known as the Institute of British Architects. In 1834 also the old Houses of Parliament at Westminster were burnt down. The foundation of the Institute, and its incorporation by royal charter shortly after, indicated the arrival of the profession of architects in England at a significant stage of development and of organisation. The destruction of the important edifice which had accommodated the business of the Legislature afforded an opportunity to that profession to enter upon a new career. The accession of the young Queen Victoria in 1837, involving the inauguration of a new national spirit, may be regarded as one more, and perhaps the chief, in this group of events; and if we further include the advent, within a short time afterwards, of Her Majesty's most admirable Consort, as an ally to the great cause of culture—and more especially, as regards our present purpose, with reference to the splendid new Palace of Parliament, by that time waiting for just such help as his—we see, clustered within the compass of half a dozen years, a concurrence of circumstances by which there is constituted with remarkable precision just such a point of departure as we desire.

Let me remind you of the somewhat analogous combination of events under which English architecture started on a new line of development in the latter half of the seventeenth century:—the overthrow of the gloomy Puritan ascendancy, the establishment of a new and brilliant royalty, then the disaster of a great fire—we will call it the burning of the Cathedral of London—and the rise of a great architect. So also at the time now before us we have, in the death of William the Fourth and the accession of the youthful Victoria, the old worn-out Georgian Philistinism going down at last, rude and dogged as ever, and another social system arising, entirely new and bright, the hope of the world; and therewith another great fire, and the rise of another great architect. I am accustomed to speak of Wren and Barry as the two great architects of modern England, in whose especial eminence there is as yet no third great architect quite entitled to claim a share. With both of them alike, everything their hand touched seemed to turn to a certain personal graciousness of form not easily described or accounted for; neither of them, perhaps, attaining to the ideal which we are beginning to conceive of the perfect master of our wonderful art, with whom mechanical science and æsthetic grace advance hand in hand from the sketch to the consummation; each of them, indeed, in his degree very notably a designer of superficiality, if the truth must be told; but both accomplishing that superficiality with an infinite success of elegance altogether his own artistic quality. From the Great Fire of London, that is to say, and the career of Sir Christopher Wren, to the burning of the old Parliament-house and the career of Sir Charles Barry, there extends a period of English architectural history which represents the whole development of popular Neo-Classicism, from its rise to its fall; from St. Paul's Cathedral and Greenwich Hospital to St. Pancras Church, the National Gallery, the British Museum, the Club-houses, and the plaster façades of the Regent's Park; when it was time at last that some change should come; and, if only as an enigma for your consideration, I think I see at the very beginning of this manifestation and at the very end the two most conspicuous masters of the situation, with no equal between. Perhaps I may go on to remark, as a coincidence, that from Barry's day to our own there extends the course of another remarkable architectural development, with its most powerful and characteristic exponents again at the beginning and at the end, Pugin and Street. I commend these circumstances to the curious: at the moment when Barry in his Club-houses offered us a new version of Wren's Classic, we threw it over and reverted to Gothic; and at the moment when Street in his Law Courts has brought Pugin's Gothic to supremacy, we now cast that aside and return to Classic. Such is the play of action and reaction; art is a long story, but its chapters are short.

#### *Victorian Age.*

At the commencement, then, of the Victorian age in which it is our privilege to live, this was the condition of architectural art in London. Sir John Soane, in old age and retirement, was the efficient representative of the best commonplace Greek taste. Cockerell, his successor in the professorship of the Academy, was the much more brilliant and accomplished exponent of the higher

theoretic level of the same school. Smirke and Hardwick, on the lower ground of mere successful business, were of still the same order of designers. Wilkins's National Gallery and University College had been produced as exemplars of what Anglo-Greek ought to be, and had failed to secure the popularity expected. Barry—whose age was under forty when he stood on Westminster Bridge staring at the conflagration of the Parliament-house, and dreaming inexpressible dreams—had designed his two Club-houses in Pall Mall in a novel mode, and had received the applause which had been denied to Wilkins. I need only add that at the newly-established Institute, Tite, as a representative of the rude energy of a prosperous commercial practitioner and an adherent of the convenient abstract eclecticism of the thorough man of business, divided the leadership with Donaldson, most indefatigable writer and speaker, to whose entranced intelligence the study of architecture was a worship, and its miraculous origin in far antiquity a faith that never could be shaken. The extreme refinement of the state of opinion which I have thus indicated was endowed with shape and purpose by the Society of Dilettanti, under whose authority the latest and most characteristic enterprise of a long series was undertaken a few years afterwards by Mr. Penrose, in his elaborate admeasurements of the optical corrections of the Parthenon, the supreme and final outcome of a system of criticism which the world can never now be at the trouble to revive.

The inevitable operation of the natural law of reaction and revolt had meanwhile been producing in many minds a feeling of antagonism to this attenuated and traditional Classic. Romanticism, in short, of the more robust order had begun to despise criticism so effeminate and so frigid. Now, English romanticism takes two forms, ancestor-worship and ecclesiasticism; and in both of these forms a change was coming over architecture. The Oxford movement, or High Church movement, or Mediæval revival—call it which you will—was acquiring force in the Church, whilst as regards the State, no sooner was it understood that a new palace of the Legislature was to be built on a grand scale, and that Sir Robert Smirke, as one of the standing architects of the Government, had been commissioned to prepare the design for it, than members of Parliament began promptly to agitate for a patriotic adoption of what was then designated the Baronial style—"Gothic or Elizabethan" was the phrase eventually accepted—and for the transference of the architect's retainer from the hands of the prosaic Smirke to those of some unknown romanticist who should be selected by means of a public competition. Barry won the prize; and at the present moment, when an enthusiastic belief in the virtues of competition has been revived, in the hope that "fair play" will cure all evils (and fair play seems as coy as ever in answering to the call), it is interesting to remember that the fairness of the selection of Barry's design was never challenged by any criticism more severe than this—that the favour of influential friends at Court had not been refused, and that the ablest specialist assistance had been wisely secured.

The adoption of this design for the new Houses of Parliament consummated the Gothic revival. The Baronial idea instantly took the fancy of the public; it formulated an innovation, allayed a disquietude, and satisfied the demands of a genuine reaction. Churches, it was true, had been built for some time in various kinds of pointed arcuation; castles also had been built for patriotic squires, even by Wilkins himself, with Gothic arches of no particular form, and some of them with Gothic cannon—cannon of wood frowning ornamentally from embrasures of stucco; cathedrals also had been restored by the help of cast iron and compositum; and London dining-rooms had been ingeniously adorned with tracery cut out of thin deal, and grained and varnished; but now all this was to be improved upon. Pugin fulminated his anathemas against everything that was spurious, everything that was pagan, everything that was modern; even the dainty engravings of Britton and Le Keux's cathedrals were supplanted by the masculine lithographs of a new school of travelling sketchers; Ruskin arose, as the prophet of a mysterious gospel unknown to the multitude; and England found itself at the commencement of an incomprehensible architectural civil war.

The contending parties gradually organised their forces. One called itself the Gothic party; the other the Classic party. There was a third, stronger than either in all but enthusiasm, which called itself the Eclectic party. At first, indeed, the Gothicists, like all originators of revolution, had to content themselves with the pleasures of hope, and to console themselves with the exercise of scorn. England is the home of compromise, and it was at length agreed that Gothic should be recognised as the proper mode for churches, Elizabethan for country houses, and Italian Classic for municipal buildings. It was agreed also that every individual practitioner should be permitted to do his best in all three styles, or, indeed, in any other he pleased, and to claim the respect of the world for so doing. Cockerell, in his Royal Academy lectures, pleaded earnestly for what he called catholicity, or universal forbearance. Donaldson, at the Institute, consented to accept the supernatural, to a reasonable extent, in Gothic as well as Greek; Tite had already actually taken a lead in Gothic design by his Scotch church in Bloomsbury; but, strange to say, Barry, the accepted prince of the practical revival, was at heart its

enemy. I believe it is quite understood that, if the Government could have been persuaded by him, the Palace of Westminster would have been built after all in the stately style of the Italian Renaissance.

I ought not to omit to mention that at this time the architectural press, as we now understand the term, may be said to have been founded. I allude, of course, to the establishment of the first of our weekly newspapers. Previously the *Civil Engineer and Architect's Journal*, a feeble monthly magazine, was the only organ of the profession, and necessarily one of very imperfect influence. The progress of architectural and engineering journalism separately, since that day, I need only say, has been most satisfactory; and I cannot help alluding especially to the remarkable development of the weekly illustrations of English architectural art, which cannot fail to be of immense artistic value throughout the world.

The year 1848 soon arrived. I need not remind you that it was a year of European revolution, out of which France, throwing off once more the embarrassments of tradition, entered upon a new and strange national career. For two hundred years Paris had been the focus of artistic culture, but of late the vivacity of the people had scarcely been seconded by the example of the Court. The Government now passed into the hands of a peculiar class of adventurous men of affairs, determined to purchase unlimited power for themselves at the price of unlimited luxury for the people. The arts do not inquire too closely into the character of their patrons; and, whatever others may have to say of Napoleon III., architects must always hold his memory in honour for the artistic brilliancy (to say nothing of political wisdom) of the architectural operations which he so successfully conducted.

English architecture had not hitherto sought for inspiration in Paris. Neither, indeed, does it now; and I venture to think it never will; for, vastly as I admire all French art, I can never divest my mind of the feeling that I am admiring something whose charms are feminine. I say, therefore, that England, the very home of rough and ready masculinity, will probably never follow the precise formulas of French taste. But it was impossible that the new start which the French were making in social display in 1849 should fail to exert an influence upon English art in one way or another. The inauguration of the great system of international exhibitions brought this influence into play; and the years 1851 and 1855, taken together, produced a crisis in English architectural history which is now seen to have been almost more notable for its results than any other incident of the kind in modern times.

When the exhibition of 1851 was opened, our professional world stood thus. The Prince Consort, now at the enterprising age of thirty-two, had become an important agent in the progress of general culture in his adopted country. It was soon understood that he had a considerable respect for architectural work, but that he had not the same regard for English architects. Perhaps this was partly due to the fact that the criticism of artistic building was in the confusion I have lately described, and that it occupied indeed what must be called low ground, a sort of unscientific squabbling ground to which a high-class German intellect might scarcely see its way to descend. Amongst the public duties which had come to be imposed upon him, one of the most prominent was the administration of the artistic completion of the new Houses of Parliament; and we may suppose him to have thus become deeply impressed with a sense of the tradesmanlike condition (if the phrase may be excused) in which he found popular English architecture and its auxiliary arts as a whole; a quality which is now candidly recognised as having been only too forcibly manifested in those days. I do not wish to attach to Prince Albert the character of a personal leader—it would be false criticism to do so; but I think he was a particularly good representative of an impending change in the public intelligence of England; and it is no doubt the fact that the very peculiar unpopularity of the profession of architects, which, during the last fifteen or twenty years especially, has been so frequently exemplified to our cost, took its rise in the early days of the Prince's intervention in architectural affairs. The standard-bearers of the day, let us remember, were Barry and Pugin, Ruskin and Fergusson, Scott—or rather Scott and Moffatt, and Donaldson and Tite at the Institute. Barry's work at the Houses of Parliament was advancing tediously and mysteriously, and a sort of Philistine grumble against it was constantly being heard in the House of Commons, as if the architect and the Legislature were not pulling together. Then Pugin, as the exponent proper of the Gothic Revival, although acting as Barry's very loyal ally in the great work itself privately, was in his public capacity simply a frantic enthusiast, whose fanaticism for the Mediæval, in season and out of season, that and nothing else, made confusion worse confounded. Of Ruskin, again, one can only say—and all the more confidently now that he has in age turned against himself in youth—that the specious, reckless, often meaningless rhetoric of his charming writings stirred up a vague and spurious sentimentalism, which, without benefiting architecture, was doing infinite damage to the architect. Fergusson, next in order, although as dogmatic as Ruskin, was as prosaic and cool as Ruskin was poetic and impassioned, and as well disposed to the working architect as Ruskin was scornfully inimical. But he cannot be said to have helped the profession, by

his very considerable services to the art, so much as he unconsciously disparaged in the eyes of the public an order of artists who required an amateur to teach them. I have next mentioned Scott and Moffatt. For the moment I do not see the great ecclesiastical designer of a later date, but only the firm of reckless public competitioners, in whose hands the abuse of a practice, always signally open to abuse, had already attained dimensions which could not fail to bring down sooner or later a dignified æsthetic profession to the level of a grasping trade. Much as I revere the memory of Sir Gilbert Scott, I feel that I should be false to my duty at the present moment if I were to hesitate to blame him, and his too clever partner of forty years ago, for their introduction of a mode of struggling for work at any price, which I believe to have done an amount of injury to English architects only less than that which, I am sorry to say, I think it has yet to do. I have spoken lastly of Donaldson and Tite at the Institute. Of Professor Donaldson, I need only say that so far as a high-minded and fearless maintenance of the lofty character of our splendid art and its literature, and of the honourable historical position of our artists, antiquarians, and critics, could defend us against assault, whether vulgar or refined, he never for an instant swerved from his duty as leader of the guild; and of Sir William Tite, although a man of very different qualities, I am glad to say, from personal knowledge, very much the same. By this time, I may add, Professor Cockerell, who never was wanting in courage to champion the cause of his order, could scarcely be called upon to be more than a looker-on.

I must now speak of that remarkable man, Sir Henry Cole, whom I regard as having taken an exceedingly earnest and effective lead in the change which was coming over English art architectural. I use this term—*art architectural*—in order to suggest to you an important practical distinction between the academical architecture of the period preceding 1851, and the non-academical *art architectural* art in general which then began to take its place—a whole galaxy of constructive, formative, decorative, and industrial arts being now in question, amongst which the pure building-art of old traditions was but the central star.

Cole had for the work of his life the advancement of what we have been accustomed to call the minor arts; and there can be no doubt that he began upon the basis of a personal dislike to the professional practice of architecture, which he maintained to the end and bequeathed to his successors. Rightly or wrongly, he seems to have arrived at the conclusion that the architect was a fossil, whose function in the streets of ancient Rome, or in the cloisters of Mediæval abbeys, or in the market-places of modern but not too modern Italy, had no doubt been a useful function, judging by the remains of his performances, but who in modern London was a doer of nothing to speak of, or of nothing but what could be done quite as well without him. As matter of business, we know this to be mere folly; there is perhaps nothing in the work of this world which the untrained intelligence can never hope to accomplish, if the proper design of a high-class building be not such a thing; and the continual endeavour of uninformed persons to do their own architecture, in spite of a thousand failures, is only evidence, indeed, of the fascination of the unattainable. Cole, however, seems never to have permitted himself, as so many do, to be an amateur architect, or even to have encouraged anyone else to be so; what he underrated was, not art, nor even business, but men. His own soul was wrapped up in detail, and he found the architects, as he thought, to be devoid of the knowledge of such detail, and content to trade upon a little experience merely in the drudgery of supervising building contractors. When he fell in with an architect like Digby Wyatt, who knew all that he himself knew, or could wish to know, of the arts of detail, and who knew also that which he acknowledged to be beyond his own reach, the whole volume of the historical art of splendid building, he could honour him, and did honour him as far as was convenient; but if the mere art of building, without the arts of detail, were alone in question, his opinion was that the Royal Engineers could manage that quite as well as anyone need desire, and indeed all the better because of one thing, that they were soldiers under discipline, and not like a good many architects he could name who were not under discipline—and whose successors, if we must tell the truth, are not under discipline yet.

The fact that the Prince Consort had built Osborne in 1848 without employing an architect (although the builder, of course, employed one) may have been encouraging to Mr. Cole when they came to compare notes; but the view of the matter which I prefer to take, as I have already suggested, is that both of these extremely intelligent and earnest men were in fact exercising shrewd foresight, and not merely cherishing a personal crotchet. At any rate, the immediate result of the Great Exhibition of 1851 was to open the eyes of Englishmen to the fact that the subtle spirit of artistic design ought to run through a great many branches of industrial production which they had been accustomed to regard as scarcely worth the trouble. That many of these were more or less related to building, or to the decoration or occupation of buildings, was plainly manifest; and the triumph of Cole was that he had laid a foundation for the popularity of the whole world of decorative arts, and, amongst the rest, the minor arts architectural. The Exposition held in Paris in 1855 carried still further the same

idea; and some English architects began to perceive that their studies must go more and more into the detail of general art. Architecture was therefore now on the move in a new direction.

### South Kensington.

Under the remarkably clever personal administration of Cole, the practical outcome of the exhibitions speedily acquired form and substance in the institution of national Schools of Design, and eventually of the South Kensington Museum. The establishment of the Crystal Palace also at Sydenham, for an artistic popular resort, ought to be coupled with these undertakings, as being a measure carried out with the same end in view. As regards architects, it was no doubt a remarkable and perhaps unfortunate circumstance that a duke's gardener had to come in to design the exhibition edifice, as if to show that it was not in artistic building alone that architects failed to keep pace with the times, but in scientific still more. We are not bound, however, to accept this view of the incident, and certainly Paxton never made his mark in either art or science.

"South Kensington," as it has long been popularly designated, in the character of a somewhat self-assertive bureau of the Government, may, I think, be described as the headquarters of art multifarious, no longer academical, but essentially non-academical. By academical art I mean to indicate, in the restricted sense, the old conventional "circle of the arts" as accepted by the Renaissance academies, comprising painting, sculpture, architecture, and no more, and all on the high level only of dignified tradition. When, for example, no longer ago than 1854, we find Mr. Tite's contribution to the Royal Academy exhibition to have been *A Composition of the Works of Inigo Jones*, and Professor Donaldson's *An Architect's Dream, or Sketch of a Design for Opening the Crypt of St. Paul's* (after the manner of the Invalides at Paris), we can acknowledge now that academicalism had reigned quite long enough. We can also acknowledge now, when we have in a great measure enfranchised the practice of the art from such inconvenient formalism, so that our Classic and our Gothic alike are often almost too free in treatment, and too demonstratively defiant of the categorical criticism of the schools, that the practical function of the architect has acquired at the same time extended limits. He can no longer rest content with having provided a building that is merely conveniently planned, properly constructed, and well proportioned, which other hands shall then clothe with decorative work, and furnish with ornamental accessories; there is finishing work everywhere, minor art work, which is part and parcel of his scheme and which he must himself design and control; there is characteristic carving, for instance, and he must direct the carver; painting, still more; there may be even set pictures and statuary sometimes; there is metal-work, glass-work, plaster-work or some equivalent, even paperhanging or some equivalent, and so on; there is floor-work, wall-work, cabinet-work, furniture-work; sometimes upholstery, carpets, tapestry; a multitude of miscellaneous fixtures and fittings, and even unfixed ornaments; all of these may more or less put in a claim to be "endowed with artistic merit" by the one designer, lest anything unexpectedly awry should mar the effect of the whole design. And this great change in the scope of the architect's work has come about, I think, in response to a corresponding change in public feeling, which must be associated with the operation of South Kensington policy. Indeed, I am almost inclined to say that the *bric-à-brac* style, for such it is, of what we call Queen Anne architecture, is properly the South Kensington Museum style. Cole personally, the paramount genius of South Kensington, was originally, as Felix Summerley, content to devote himself for ever to *bric-à-brac*. There are cynical critics who will speak of the whole Museum as *bric-à-brac* still. And I, for one, have no objection to this, if I may take leave to identify with the name of *bric-à-brac* the idea of art multifarious and non-academical, that which underlies the entire range of the minor arts, unformulated often and unconventional, but constituting an inexhaustible source of everyday enjoyment which our Academies, when inflated with the pride of empty traditions, are disposed to ignore rather than attempt to work.

But the Gothic revival, no doubt, is entitled to claim a considerable share in this expansion of the architect's work—his work, let me say, as chief of all the workmen. Pugin, for instance, was especially an apostle of the minor arts. The Neo-Greek diletantism that preceded his day, and the Georgian Philistinism together, may be said to have shut the door upon them. It was under the successors of Pugin—his direct successors in Gothic enthusiasm—that they acquired the form and force they now possess in architectural business. South Kensington could never, perhaps, have converted the narrow connoisseurship of *bric-à-brac* into an expansive public interest in every possible kind of decorative and ornamental design, but for the fanaticism, as it is called correctly enough, of Pugin and his school. And yet Coleism and Puginism were but unconscious allies, and are no better still. To this day South Kensington recognises little beyond Italian Renaissance, whereas even our Queen Anneists—themselves staunch Mediævalists quite recently—would rather have turned to anything else they could find. At any rate, the point I desire to make is this:—that the epoch of the first great international exhibitions is to be identified

in the history of English architecture with the rise of the minor arts, which have thus been progressing amongst us for about thirty years.

#### *The Gothic Revival.*

The Gothic revival must now be described for its own sake. In the language of our popular Protestantism, this great movement was simply a return to the artistic style of the Roman Catholic or Mediævalist Church, of which it has been truly said that it is "the Church of Poetry and Art." At the date of the great exhibitions Gothicism had got so far as to have acquired not only the undisputed possession of the whole ecclesiastical field in English architectural practice, but the disposition to claim whatever secular work was worth having. The theory that Italian art was only suited to Italian soil, that England required a style that was English, and that the only English style was the Gothic, was boldly advocated; and in 1857, when the Government instituted a public competition for the intended War and Foreign Offices at Whitehall, the competitors were found to be so equally divided in taste between Classicism and Gothicism that the adjudicators felt obliged to place the representatives of the two schools in alternate order for the prizes, to the number, I think, of fourteen in all, as an official acknowledgment of the absolutely equal value of secular Gothic and Classic in public esteem. We all know how in the end Scott's Gothic design was demonstratively selected for execution just before Lord Derby's administration quitted office, and the style, almost still more demonstratively, changed to Classic when Lord Palmerston came in. Such was the Battle of the Styles.

The chief merit, perhaps, to which the Gothic party laid claim was the resuscitation of the Mediæval principle of truthful articulation, or the correct correspondence of the motive of superficial design with the motive of underlying construction. The styles of the Renaissance, they argued truly enough, were almost hopelessly entangled in shams, whilst the Mediæval, they said, had nothing to conceal or to disguise. This was a great step in the right direction, for false architecture cannot be true art. It is not to be affirmed, however, that our Gothic architects quite acted up to the pretensions of their school; it was scarcely to be expected that they should; the habit of fibbing on the drawing-board, persisted in from the time of St. Paul's Cathedral (which, with all its merits, is a mass of fibs), had become inveterate in England; and even now the Spartan principle that the facts of construction shall never be compromised in the design of superficiality is much too feebly recognised.

But the Gothic revival, as soon as it had acquired its full strength, brought about another result not so satisfactory to our professional repute. Architects were now divided into two "camps" (to use the appropriate language of Sir Gilbert Scott) regarding each other with "mutual scorn." English people may fully appreciate in politics the advantages derived from the antagonism of parties, but in art they do not. Consequently, when Gothicists proclaimed Classicists to be, in plain language, foolish brothers, and Classicists said very much the same of Gothicists, the character of the whole profession was lowered inevitably, and the effect was only too distinctly apparent in Parliament and the press. Within the profession itself the authorities were divided in doctrine thus:—Gothicism rested its claims of superiority chiefly upon its qualities of honesty and masculine fortitude, which in the work of Street and some others were soon developed into something like a contempt for the graces; whereas Classicism relied upon the concurrence of all modern Europe in its adoption, and while fully acknowledging the sin of sham, deprecated the substitution of ugliness for beauty, however masculine the one might appear to be, or however feminine the other.

#### *Mr. Ayrton.*

There thus arose outside the profession a new Philistinism. Before many years it acquired unexpected importance by reason of the appointment, quite accidentally, of Mr. Ayrton to the office of First Commissioner of Works. Ayrton was a very Goliath of the Philistines, and when Edward Barry had the temerity to encounter him he went down before him in the most melancholy manner; and unfortunately he dragged us all with him, so that the unpopularity of architects became established as almost a national principle. But it is due to South Kensington to give it most of the credit, or discredit, of this consummation. Cole may be said to have hated not only architects, but all classes whatever of professional artists of the academical order. He regarded their pretensions on all hands alike as a mere traditional, conventional, and spurious self-importance, impeding the progress of those minor arts which he considered to afford the true pabulum for national taste. Accordingly, as a rule, whatever had to be done artistically under Cole must be done, so to speak, non-professionally; and, inasmuch as architecture was the most prominent of the professional arts, it was determined that, when building had to be done for South Kensington itself, the professional architect should be emphatically set aside. The military engineer was demonstratively substituted. Captain Fowke, a young officer of much general ability and of an amiable and well-disciplined nature, was made the representative of this policy. He became a favourite with the Prince Consort; he proved to be a man of large ideas;

he entered thoroughly into the new system of artistic enterprise; he made a special study of new materials for design, such as iron and terra-cotta; and he was at once a judicious chief and a judicious subordinate. He died early; but if he had lived longer he could scarcely have accomplished more than he did. His successor, General Scott, carried on his work on the same lines; but Scott, being of a more genial temperament, allowed the architectural world, if not the public, to discover at last the hollowness of the system, by acknowledging frankly that he himself was no architect at all, even although that very grand edifice the Albert Hall was nominally his personal work. But I need not remind you that, when the Albert Memorial had to be built, South Kensington discreetly made no attempt to commit it even nominally to the artistic mercies of the Royal Engineers.

#### *The Last Twenty Years.*

We have now arrived at a period of less than twenty years ago; and the condition of English architecture was this, as illustrated in the great competition for the Law Courts and the National Gallery. The Battle of the Styles was still in progress, and it cannot be denied that the Gothic party was victorious all along the line. Scott, Street, and Burges were its most prominent champions. Scott had the unassailable leadership in ecclesiastical work everywhere. But the qualities which made him so popular socially with a body of men like the clergy rendered him incapable of maintaining that militant attitude which so much better suited the disposition of his eminent pupil Street. Again and again, in obedience to the call of partisanship, and to the dictates no less of his own sincere earnestness in the admiration of what we may call the milder Gothic, Scott came forward as a combatant Mediævalist, and even made use at times of language that appeared to be strong. But no one was ever any the worse. In Street, however, the genius of the Revival possessed a soldier after its own heart. Even Ayrton had met his match; and indeed, such has been the effect produced by the architect's undaunted attitude to the very end of his life, that the lawyers themselves in high places, exasperated at the universal anachronism and anomaly amidst which they are compelled, through sheer force of this one dead man's will, to perform their uneasy business, exclaim against him with bated breath. The third of our great Gothic trio, Burges, was not so much a man of power as of a certain playful fanaticism which induced affectionate forbearance and never provoked to wrath. With his intimates he was "Billy"; I wonder if anyone ever called Street "Georgy"? But, of the three, Burges was by far the most simple artistic spirit. Scott was a laborious and pushing man of business with a congenial occupation, Street a fighting ecclesiastic, Burges an enamoured boy; one Low Church, one High Church, one No Church. But these three together represented the triumph of the great Gothic revival; and how strange it must appear to some of us that this triumph, which, like all our little mortal victories, seemed at the time so enduring, is now only an incident of history, and yet but a few years old!

By an ingenious contrivance of somebody's, the urgent demand for new Courts of Justice and the supposed desire for a new National Gallery were so combined together and made the occasion of the brace of competitions alluded to, that Gothic should have its own way with one and Classic with the other. The Classic leaders of the day, however, were neither many nor strong; all the real artistic vigour was now Gothic—romantic. The result of the contest, after the customary vicissitudes, was the appointment of Street to build the Courts of Justice in an Academic style, probably the most severely uncompromising that had ever been attempted in the world of archaeological art. The edifice has but recently been finished. It is a monument of artistic resolution, and, of course, of artistic skill. But it is much more than this. Such is the fearless muscularity of its artistic attitude, such the vehemence of its characteristic Gothic force—let me at once say ruthless violence—that without it the whole process of the Revival had been quite incomplete. But, for that very reason, the consummation at length accomplished, it was fit that the great movement should confess itself exhausted. Street died at the very goal, and his cause died with him. Except in ecclesiastical work, our modern Gothic of any high pretension is now no more; it has done its service, and done it well.

#### *Queen Anne.*

A popular successor to the style of secular Gothic has necessarily been growing up of late years by the mere action of natural law; indeed, such is the leisurely pace of architectural reform, that the new mode has been making its way slowly for more years than may be generally supposed. This is what is somewhat inexpressively and arbitrarily called by the name of the Queen Anne style, as if it were an act of mere revival. But I have suggested to you that it is really a *bric-à-brac* style peculiar to our own day, a minor art style which the influence of South Kensington may claim to have brought about, even if unconsciously. Within its own limits, and directly, no bureaucratic influence can do much in the way of producing a change of public architectural practice; it is a public demand which alone can have that effect. But it was South Kensington, as it seems to me, that created the public demand, now being satisfied by means of an.

infinitude of charming picturesque detail, chiefly appearing, however, in the design of small works. This is a much more philosophical way of accounting for the change than by attributing it to accident, or to any sort of personal authority. But Mr. Norman Shaw, whose modest and painstaking perseverance of character especially qualifies him, with the help of extraordinary dexterity of draughtsmanship, to be the unambitious agent of an artistic manifestation of this kind, fully deserves the credit of leadership; and he has been followed by a few equally brilliant men who have now unquestionably attained the status of a school, and one whose merits are becoming very considerable.

It is an exceedingly interesting exercise in criticism to inquire what is to be the outcome of this very peculiar movement. That it must gradually lose itself in a return to the universal European Renaissance, may probably be safely asserted. We must bear in mind—neo-Medievalist criticism being here altogether unscientific—that this great historical style, taken in its entirety, although often called Italian as an alternative title, was never such a thing as a merely local Italian which by accident happened to spread over Europe. It was a *Modern European* style, which took its rise on the spot where modern Europe had its birth, and at the date when modern Europe was so born. To say that it spread westward until it had overrun the whole European world as a universally accepted mode of building, and that it has been maintained in use ever since, and still is maintained for all ordinary purposes without a question being raised—except by people who are before the age, or behind it—is to describe exactly the process by which every great style of design necessarily conquers its allotted territory; and when we in England claim credit with the world, as we do, and are fully entitled to do, for the exceptional merit of having originated and carried to great perfection the Gothic Revival, as a special act of characteristic motive which has now reached a turning-point after having fully satisfied our desires, what is this but a confirmation of the principle by a most unique exception?

#### *Future Prospects of English Architecture.*

If we now proceed to look a little more closely into the future, we have to account for three styles at present in use in England. First, there is the customary style of Modern Europe; secondly, the Revived Gothic, or the style of Medieval Europe; and thirdly, a certain popular and local mode which I say differs from both but takes after both, essentially a minor-art style, and obviously transitional, prompting us already to ask ourselves what is, fourthly, to follow for a permanency?

In the first place, let us take the Gothic. Now the Gothic Revival—which, as I have already said, was a return to the whole artistic system of the grand Medieval church—*par excellence* the church of the imagination—so far as its ecclesiastical purpose extended, has not by any means exhausted itself. Architects of the type of Mr. Butterfield on the one hand, and of Mr. Pearson on the other, have, I think, a long career before them still; that is to say, Gothic churches show no sign of losing their popularity in England yet. But in municipal and domestic work the case is different, and the secular Gothic having culminated in the London Law Courts, has surrendered its claims for ever. But let me put the case in another way. The movement of national sentiment which produced the Gothic Revival—and in its particular form, I observe once more, it was peculiar to England, other nations being mere imitators—was partly ecclesiastical and partly social. It was the social phase of it which operated in 1834 in the demand that the new Houses of Parliament should be designed in what was called "Gothic or Elizabethan." This was for the sake of archæology. Up to that date, and long after, when new churches were built in so-called Gothic, this also was not for any reason properly ecclesiastical, but on archæological ground alone. The ecclesiastical motive, however, was all this time developing itself, chiefly in the Universities; and in due course it came before the general public in the rise and progress of a powerful theological party. Now we are not theologians here, but artists; and the way in which we have to look at this very remarkable social phenomenon is, I think, to regard it as an inevitable artistic reform, using the term in a very wide sense. It was the introduction of the infinite artistic element, or poetic element, into the English Church, as opposed to a dull and dismal Philistinism which had been in possession of it for many generations. We were to have for the future artistic music, artistic decoration, artistic ceremonial, artistic architecture, and, as I venture to add, artistic doctrine and discipline. This, I may safely affirm, is the harmless way in which the people at large have always looked at the case; and it is especially proved to be so by the circumstance that even the Non-conformists and the Scotch Presbyterians have accepted the new system as far as they could. I need not remind you how earnestly it was embraced by English architects; in fact, we may say that architecture has been almost the helm of the enterprise, answering to every call with a readiness of resource for which English genius may justly claim the lasting admiration of the artistic world. It is the ecclesiastical Gothic, therefore, as the style of artistic religion, that I regard to be the only natural or historical form of the Revival. That it has taken a strong hold upon the affections of the people cannot be doubted, and I scarcely care to ask you to fix a

period for the duration of its popularity. Like all other manifestations of sentiment, it must in time give way to something new; but let us hope at least that it may be something better rather than worse. Looking again at the influence of the minor arts, it must be borne in mind that, as they stand in practice, they owe almost all their present importance in England to their revivification by means of ecclesiastical architecture; so that, if it should be through the minor arts that the coming style of architecture is to be determined, there seems to be no reason why this should affect our revived ecclesiastical Gothic otherwise than by the continued amelioration of its sometimes too masculine manners, an effect which is not by any means to be discouraged.

As regards, in the next place, the exact position amongst us of the general Modern European mode, from which the French, the Italians, and even the Germans have never swerved, as we have done—except in mere superficial imitation of ourselves—I have only to repeat what I have already said, that we cannot help returning to it, and that, indeed, we are already so doing.

#### *Motive of the Queen Anne Movement.*

Turning now to our third manifestation—the so-called Queen Anne—I think one motive which lies at the root of it may be thus described. Secular Gothic had for its principal basis the element of picturesqueness; it was, indeed, frequently designated the picturesque style, as thus distinguished in spirit from the Classic style or style of repose. When, therefore, it was found that municipal buildings and private dwelling-houses designed in this manner, unless all authenticity were expressly sacrificed, proved to be unacceptable to the ordinary feeling of the day, and that, in fact, English common sense, while admiring the picturesque greatly, pronounced against the practical inconvenience of obsolete forms and arrangements, it was necessary to find something to take the place for a time of the rejected style, without surrendering the picturesque character. Mr. Norman Shaw and his colleagues have accomplished this end, as I think, successfully; and it was done by means of the subsidiary art of what I will venture to call *sketchmanship*. The Gothicists had become enthusiastic sketchers; Street was the very prince of sketchmaking out of doors; in fact, architectural sketching of the picturesque order was found to be the *forte* of Englishmen, bringing out in all its force the rough-and-ready national preference for experimental study instead of philosophical. So what was done was to make sketches of a new class of picturesque old buildings, not necessarily pure Gothic, or not even Gothic at all. I am afraid I must say that the specimens selected turned out generally to be Dutch. In a word, with the help of the good-natured name of Queen Anne, whose reign coincided sufficiently well with the use of a kind of Dutch art in England, there was at length brought about a certain popularity for red brick buildings with features neither Gothic nor Classic, but quaintly pleasing, and, so to speak, of a sort of old English type. Nothing could be better suited for such an occasion. The recent development of the minor arts, moreover, was fully recognised; for Dutch art and *bric-à-brac* are never far apart. And so the Queen Anne architects are making a very good innings, and just now are doing better and better work daily, although no doubt still leaving room for improvement. Some of the drawings of interiors more particularly, which are produced under names unknown to most of us, seem to me to evidence a degree of manual dexterity which ought to tell upon the artistic handling of a higher class of architectural style when the time comes.

What, then, is this higher style to be? I can only suppose, as I have said, that it must be the standard Renaissance in some form or other. We may now ask, therefore, whether England is to insist upon producing any modification of it to suit her own national character; and here a very interesting point comes into view. It is said that, in the history of modern intellectual development, the two races which occupy Europe, the Latin and the Teutonic, stand in this relation to each other, that the Latins initiate what the Teutons perfect. The more imaginative genius of the French and the Italians, that is to say, having its function in the origination of almost all great discoveries, it is the more practical scientific power of the Germans and English that assumes the task of their development. If this be true with reference to the arts, England in the coming generation may be destined to take the lead of even France; and I for one have no objection to look this possibility fairly in the face. Already the Ecclesiastical Gothic of England in our own day may certainly hold up its head beside anything that France has done; and perhaps in the coming Renaissance we may find ourselves no less able to compete with our gifted neighbours. Bright and joyous as the French Renaissance always is, there may be a certain vigour of manliness reserved for the English, which, in an age of increasing manliness and increasing English influence, shall accomplish unexpected results. It is of little use to speculate about the mere details of one academical style or another, and the introduction of this class of features, and the rejection of that, as if personal authority were to govern the course of events; natural law will have its way in this as in all else, and if English intellectual enterprise is to be fairly challenged to accomplish an adaptation of the somewhat hard-worked forms of the Italian-

European, I do not see why in the next century an *English-European style* should not take the lead throughout the world.

#### *Present Aspect of the Movement.*

Let us further inquire what is the present drift of English architectural sentiment in the abstract. The Mediæval romanticism which a few years ago was the dominant feeling has recently been disappearing with such a strange rapidity that it seems almost doubtful whether the secular Gothic party have not deserted to the enemy in a body. Now, I confess I should be sorry if this were really so; because I think the peculiar artistic enthusiasm which actuated Pugin, Scott, Street, and Burges, cannot well be dispensed with for some time to come. No doubt a new enthusiasm will spring up; but the Queen Anne movement is not such a thing; it is an impulse of a much more feeble and evanescent character. The attitude which is assumed by the somewhat mysterious organisation of "The Society for the Protection of Ancient Buildings" seems for a moment now and then to be all that is left of the Gothic enthusiasm; but on closer acquaintance this impression is not confirmed. For it declines emphatically to be considered representative of Gothic alone, or, indeed, we may say, of Gothic at all. Its object is not even artistic, but historical; to preserve what is left of the past in the most indiscriminate way; whether good or bad, old or new; preserve it all, so that the reverie of the wayfarer may have not only something authentic, but everything veritable to dwell upon, even when the light of life, perhaps never a very bright light, has quite gone out. This, I need scarcely repeat, is not an enthusiasm of art, indeed, scarcely one of archaeology; and it has become identified with architecture only because buildings are the most conspicuous relics for such a form of patriotic reverence. I may add, moreover, that the influence of archaeology itself upon architecture seems within the last few years to have given way; and I think this is to be regretted too, inasmuch as our archaeologists, like our old antiquarians the dilettanti, if only as matter of prestige, brought the element of learning into prominent connection with our noble work. The minor art architecture of to-day exhibits again in these respects its conformity with the South Kensington principle, which, in making art a thing of popular skill, and not of academical knowledge, widens the ground that is cultivated, but at the expense necessarily of the depth of cultivation. That our present age is one of superficiality in many other matters besides this, is a well established fact; and I am not sure that it is to be regretted; for if we can see that the field of art, as actually enjoyable by the multitude of us, is thus being extended so largely, we may well be content to let the learning reappear in its own way and at its own time.

#### *Influence of Draughtsmanship.*

But there is another point to be noticed here, namely, the way in which the architectural arts are being controlled and even directed by the artifices of draughtsmanship, or sketchmanship, regarded as a delightful, but delusive, sleight of hand. In the minor arts of decoration, such as glass-painting, carving, painted ornament, and so on, it is easy to see that clever drawing is in a great measure the essence of the artistic manifestation; but we cannot shut our eyes to the fact that in the now very pleasant work of furniture design, when in the hands of architects, the same clever drawing is fully accepted in the same way; and, as matters go, it is but a step in the style of the moment from furniture to building. Our architecture has thus come to be sketch-designed and sketchy, careless and vague in detail; a thing of scene-painting, picturesque at any price; restless and not necessarily anything else; exceedingly clever on paper, and, when carefully carried out, pretty and piquant in execution, but greatly wanting in the nobler qualities. I do not suppose, however, that this will last long; and, even before the so-called Queen Anne mode itself gives way, we may expect, I hope, to see a more careful manipulation of the modelling becoming universal; indeed, it is already making progress.

#### *Mr. Ruskin.*

Another matter of sentiment to be noted is the abatement of that cynical poeticism which was introduced by Mr. Ruskin. I never could understand why this exquisite dream-painter should have ever taken up such a subject as architecture, except for the indomitable courage of the thing; but there can be no doubt that his visionary doctrines—and the more visionary necessarily the more vague—have had a great effect in helping what was weak English art to conquer strong English Philistinism; and, if this involved a certain amount of inconvenient romancing when applied to the practical work of architects, such a result might be expected to appear, and the effect of the medicine must be allowed to wear off by degrees. At all events, now that the artistic spirit has taken possession of us, we need not grudge our thanks to the influence, perhaps upon the public mind more than upon the professional, of the writings of Ruskin.

But we have nevertheless still to face the fact that in high places in England a new Philistinism has been for many years acquiring a certain force—indeed for thirty years—an influence antagonistic both to architecture and to architects. The building of the Houses of Parliament in a Gothic style was no sooner fairly under way, than the common sense of the more utilitarian order

of men connected with the Legislature revolted against it as an anachronism. The architect of the structure, even if he himself had been at first of the same opinion, had of course to take all the blame; and, when the edifice came at length to be occupied, there was a cry raised of inconvenience and incongruousness, which has been kept up ever since. In course of time, when the son of the great architect, thinking he had acquired by his father's bequest the position of a hereditary successor, came into collision with Mr. Ayrton, and was ruthlessly defeated by that champion of the Philistines, backed by the unsympathetic logic of the courts of law, it would be idle to affect not to see that the pretensions of architects—the Prime Minister himself had to say they were untenable—had come to be seriously distrusted. The immediate effect of it was that the Government determined to dispense with outside architects by making use of the officials of the Department of Public Works; and it is still understood that this rule is practically in force for a permanency. The charges made against the profession on this ground are shortly these:—that convenience and economy are sacrificed to monumental appearance, and that the severe character of the commercial contract with a builder is tampered with by the introduction of extras. Upon these questions I need only observe that the most successful architects in England from time immemorial—I do not say the most artistic—will be found to have been the most mercantile in their manners; and, secondly, that the artistic element in architecture is not recognised by law, or recognisable in any way by the legal mind. I may also point out that the typical English gentleman—and typical English legislator—is a person whose ideas of building are still of primitive simplicity, and that his impression of an architect's business is equally devoid of sentimental considerations. But I do not consider that the so-called unpopularity of architects goes really deeper than this; and if any architect who happens to obtain Government employment—scarcely ever a desirable thing, by the way—will condescend to bring his ambition down to the practical level of his private business, and to do everything in strictly commercial form, there is no reason why he should not give satisfaction.

#### *Competitions.*

One word more must be said here upon the influence of competitions. Looking at the eagerness with which these contests are entered upon, the disregard of commercial calculation that is manifested even by the leaders of the profession, and the unseemly bickering that invariably results, how is it to be expected that such men as are at the head of public affairs in a commonwealth of commercial common sense like ours should regard either architecture or architects with due respect? The logical conclusion obviously is that the designs which are so freely offered for nothing must be worth nothing, and that the men who are so ready to work for nothing must be taken at their own valuation. Nevertheless, although I believe it is almost invariably the case that it is not the proprietors that call for a competition for their own sake, but the architects who virtually solicit permission to compete against each other, I am afraid, in speculating upon the future of the profession, we must expect this practice of competing to increase rather than diminish. Sooner or later, however, some check must be put upon it, either by the good sense of the public, or by a feeling of shame on the part of the architects themselves: up to the present moment I do not see that any effective steps whatever have been taken towards that end. Still, on the other hand, I cannot but frankly acknowledge the opinion that, without the peculiar artistic exercise and enterprise which competitions induce, English architecture could not possibly have done all it has done during the last half century. I chiefly object to the great waste the practice occasions, not only in money, but in time, temper, and character.

#### *Position of Architects.*

I may now say a few words—still keeping to the artistic view of my subject—upon the position of architects in respect of business. I need not repeat in any way what I have said of the advancing popularity of minor-art architecture, and the increasing competency of our architects to deal with it. But what of the still more rapidly increasing numbers of the men who have to live by it? And what is the state of their organisation?

In the first place I may express my opinion that the Institute of Architects, established now 50 years ago under circumstances very different from those of the present day, does not display either the vigour or the intelligence which the service of the profession requires, whether we look to the interests of the art or to those of the artists. It is to be hoped that something may be done in that quarter before long; but it must take time; thirty years hence, at any rate, the Institute, we may safely say, ought to be much more earnestly devoted to the practical utilities of art than it is now.

The Royal Academy, also, if architectural art is to retain its connection with it much longer, must, I venture to suppose, enlarge its views of the minor arts considerably; and here I think we may fortunately expect to see both painters and sculptors entering into the matter with understanding as well as with sincerity.

Turning next to the educational question, we find that exami-

nation tests are becoming the order of the day; but whether, in respect of architecture, the introduction of artistic design into the programme can be accomplished, seems still to be matter of doubt. That some kind of academical diploma for art-architectural in its expanding form must, however, sooner or later, be contrived, both to conciliate the artist and to meet a public demand, can scarcely be matter of doubt.

A circumstance that must not be overlooked is the still-increasing employment of professional architects all over the country, which, looking at the sum total, is so far encouraging, even if individual instances of dissatisfaction are numerous. Not many years ago there were but few architects of really good position, except in London and the larger provincial towns. Now the smaller towns, and some that are almost villages, are occupied by practitioners who are frequently quite equal to their metropolitan brethren in skill. The pupils also of provincial men have in some instances better work passing through their hands than those who are in average London offices; and, thanks to a study of the photo-lithographic illustrations of the professional journals, their draughtsmanship is often of quite as high an order as the best in London. All this points to a condition of things in the near future throughout England in which men architecturally educated are to do a vast amount of good art-work in one way or another, and therefore in many ways. Consequently, when I hear the question asked, as I often do, what is to become of the increasing host of young architectural pupils, my answer is that they will be drafted off more and more before long into the service of many charming arts. For there is a certain peculiar characteristic in architectural training—namely, the habitude of constructional design—which, even while as yet not so devoid of the old make-believe as we could wish, is still expressly calculated to prepare the mind for that association of the superficial with the substantial which becomes the most essential charm in all formative and ornamental art when once publicly understood, and which the mere counting-house designer acquires, if at all, under great disadvantages.

#### *Engineering Architecture.*

Another point of importance in our prospect of the next generation of architects is the work connected with so-called engineering construction. Perhaps the most regrettable weakness of English architects at the present time, in point of dignity, is their want of that higher scientific skill which they allow engineers to monopolise. To give a familiar instance, it is quite common for an architect of eminence, when he happens to have ironwork of any magnitude to deal with, to hand it over altogether to an engineer to design, like a solicitor employing counsel to draft a deed. Now this is to be regretted. The reason for the practice obviously is that there is no sufficient current of such work passing through the architect's own hands to keep him up to it, and that he therefore must call in a specialist who does nothing else. It would be useless, and indeed unfair, to reject such an argument; but what I want you to do is to consider what a far superior position the architectural profession would occupy if it were publicly understood that they did all such work for themselves, even if the fact went no further than this—that the aid came from a specialist architect and not from an engineer. Still looking at art, what I should like to see is an architecturally educated man designing such a thing as the most advanced ironwork, and introducing true architectural art into it as his design went on. Otherwise, if one of these two kindred professions has to call in the specialist aid of the other, why should it not be the engineering constructor who calls in the architectural designer? Why should all our building operations of the so-called, and improperly so-called, engineering order—viaducts, bridges, great roofs, railway stations, piers, embankments, and much more—be left barren and unfruitful of grace because the designers of them, professing nothing of the artistic spirit themselves, assume that it has no connection with their work? Here, I would fain hope, we may see another sphere of business, and indeed one of vast importance and grandeur, opening out in the next generation to the English architect.

#### *Conclusion.*

To conclude, in answering for yourselves the question what is to be the position of English architecture, let us say, thirty years hence, I invite you simply to regard the profession as one that has been advancing during a corresponding period of the immediate past in a certain direction and at a certain pace which a retrospect of recent history such as I have offered seems to indicate clearly enough, and then to follow forward the same line at an increasing rate of evolution. If the next thirty years should do as much as the last fifty have done, then it becomes easy to understand that the process of development would have to cover as much ground as has been covered since the time of the foundation of our Institute and the inception of the design of the new Houses of Parliament, in the old-fashioned reign of King William the Fourth. We do not require to imagine the occurrence of any catastrophe; but the change produced upon the face of our art and our profession must undoubtedly be great, and perhaps may be greater than any argument such as mine suggests. For, during the last fifty years, Dilettantism has gone down before the Romanticism of the Gothic

Revival; and this in its turn has at length given place, after adding a very glorious chapter to the history of the art, The old Philistinism of the Georges has been vanquished by the South Kensington movement, as a movement of the people; and a new Philistinism has arisen, which has to be vanquished, and will be, in due time. The empty conventional formulas of the academical arts have been vigorously assailed by the new non-academical substantial facts, and the minor arts are already so far triumphant before the common sense of England that architecture itself has taken service in their cause, and a great deal for the better if a little for the worse. In these campaigns the whole lives of such great men as Pugin and Barry, Scott and Street, have been expended, and the task of great writers like Ruskin and Fergusson exhausted. Cole has passed through his long and busy, masterly and masterful career. The genial influence of Prince Albert, infinitely beneficial to the artistic sentiment, has already survived his own august life for three-and-twenty years. This artistic sentiment has for the first time spread all over our country, one of the kindest graces of the splendid Victorian age; and England is now ready to enter upon a new chapter of her magnificent history, not, let us hope, with arms in her hands, whether for conquest or defence, but with the fruits of science and the flowers of art. And possibly—indeed, I venture to think not improbably—it may be the destiny of England at a period by no means remote, in the development of the advancing scheme of Anglo-Saxon civilisation, to assume a leadership—such as she already possesses in so much besides—in the illustrious art which it is the pride and the joy of this assembly to represent.

#### *Discussion.*

Mr. BERESFORD-HOPE, M.P., said that he had certainly passed a very interesting space of time since their good friend, Professor Kerr, began his paper. Like the chairman of the evening he anticipated a prophecy, and instead of a prophecy he had a retrospect. Now he thought Professor Kerr showed great wisdom in that. There was a good saying—he believed it was an American one—that Sir William Harcourt brought up the other day in the House of Commons, when he was run into a corner. He said that he never prophesied unless he knew. Professor Kerr had said a great many things very cleverly and very epigrammatically. With some things he agreed, with others he did not; but to traverse his paper from first to last would be an impossibility with any due Christian charity to the nerves and spirits of the parties he had to address, so he would let many things pass. He would even admit that which was the greatest swallow—the words he said in praise of that adventurer the Third Napoleon. He was sure Professor Kerr, when he looked over his paper, would see that he began with a much too magnificent philosophy. He had to leave it as he went on. He began with a very magnificent picture of art as a course of successive evolution, successive development and improvement, and the whole result of his paper was that, instead of a development or improvement, it was a constant going forwards and then going backwards, and then going round, and then going to the left and then to the right, and such he believed it was. All of them, he thought, as they grew older—though he trusted they would never get blunted in their feelings—got more moderate in their hopes and expectations, and when they had a success, thankful as they might be for that success, they learned to regard it as a new earnest that the march of victory would be progressive, and that they would rise from height to height. Equally they learned when they had a rebuff, that rebuff might be only a transitory puff of a change of the mind, and it might be even a prelude to some unexpected success afterwards or a very salutary training in points in which they were too exuberant, too self-confident, too intolerant. He thought Professor Kerr would not expect him to disagree with him. He did thoroughly agree with him in the picture he drew of the dreary and prosaic period which elapsed between the epoch of the great man Wren and the revival of our age, and in saying that word he separated himself from that school which a few years ago was the accepted orthodox Classical school in this room and elsewhere; still even at that time there were attempts, there were great anticipations, there were scintillations of development which came to nothing, but they showed a divine spirit of originality which was still born in the architect's soul. There was one man he would always quote as being misunderstood—he meant Nicholas Hawksmore. He believed in Nicholas Hawksmore there was much of that type which had been more completely developed in their days, but which was overlaid by the pedantries of the day in which his lot was cast. Professor Kerr went on to say action and reaction. There he thoroughly agreed with him. It was action and reaction, but he thought reaction was hardly consistent with the idea of perpetual progression. The paper had mainly dealt with a period of twenty or thirty years, and in that period of twenty or thirty years great chronological accuracy was desirable, and he thought Professor Kerr, in yielding to the temptation of some striking parallelisms, had rather forgotten that. He might point out that, although Pugin had a court in the exhibition of 1851, it was but the song of the dying swan. Pugin died the year after, in 1852. He thought the progressiveness of the different schools ought to have been differently associated. He said so with some personal feeling, having early in life been associated

with men who might have been, like the conies, feeble folk; still they were men who, in their feebleness and wilfulness, did try to hold up the standard of truthfulness, and did hold up the standard of applied art. That was the school of the Forties. He had reached the time, he thought, when mock modesty would be wronging the dead as well as the living, for in the Forties the torch was lighted of architectural truth and of applied art, which popular mythical history would assign to the Fifties in South Kensington and elsewhere. He did not say they were unpopular, but they had not the *chic* to gain general popularity. The movement was the movement of a few people much spoken against—South Kensington, with the *éclat* of the Exhibition, with the Royal patronage, with the magnificent advertising genius of his friend Henry Cole—he would call him his friend, for he had gone to his rest after their many quarrels—but the movement began much earlier, and there were men who were too much forgotten now. There was one whom he would name particularly; he died early, but in Richard Carpenter there was a great genius whom the world did not fully appreciate. If Professor Kerr resolved his paper into a book, which he thought he was bound to do, he must go further. He was bound to illustrate it, he was bound to develop epigrams into paragraphs, and paragraphs into chapters, and he thought if he would study a little more, if he would not make those aphorisms and parallelisms and those rough-and-ready chronologisms, he thought that Pugin would be found to have been a man of earlier date than he assigned to him, the Classical movement would be found to have a distinct position which he had not done full justice to, and Mr. Ruskin would be found also to belong to a later date than Professor Kerr assigned to him. While he had had a great effect on many people, he thought it could be conclusively proved that most of the Gothic enthusiasm of the day was previous to him, and that he was adopted and accepted with open arms as a great ally—as a Gordon who had come to rescue the garrisons from the Goths; but these garrisons were already in arms under the Gothic standard. So, too, as to South Kensington Museum. As to the influence of Mr. Cole, he thought it would be found he was not the great leader of men that was thought, but a very clever *entrepreneur* who had availed himself of men who had already started on their career. Take Mr. Crace, for instance; he would, no doubt, be quoted as a model South Kensington man, but was he not a creation of Pugin? After all, Sir Henry Cole's work was a brilliant and a sparkling work, but it had died with him. As to the influence of archaeology on art, he was a little puzzled at Professor Kerr saying that he thought the influence of archaeology on art was failing. He should have thought it was quite the contrary; it might have been queer, misguided, niminy piminy. Surely the relation of archaeology to art during the last fifty years was not decaying, but if anything it was running to seed and to a wild exuberance. Gothic was condemned for municipal buildings. That he did not admit. Neither did he admit what Professor Kerr said very cleverly of sketch-making having beguiled the attention of mayors, aldermen, and common councilmen to breaking out into enormous Queen Anne. But after all, he gave mayors, aldermen, and common councilmen the credit of good sense, and he did not see at all why in ten or twelve years hence a building of Burgundian Gothic should not be adopted for some town hall, of that most prodigious and gorgeous Queen Anne which was embraced in all its arms by the municipality of Leicester many years ago. He forgot who was the promoter of that; but it was a very picturesque in fact it was, Queen Anneism. Art in Holland was by no means a contemptible art; it had made a great mark in Europe. Gothic, he heard, had done its work. That, again, was an opinion. Mr. Fergusson adopted an architecture by which his manner was generally known. He was first known by his book on the topography of Jerusalem. That was a topographical book which had nothing to do with the general history of architecture; but his "History of Architecture," he thought, appeared in the Fifties, after Pugin was dead and gone, and after the Exhibition of 1851 was dead and gone. Fully admitting Mr. Fergusson's power, and the great work he had done, he must rather claim he should be reckoned in the second than in the first generation of those who created the first architectural institutions of their time. They heard that in the Law Courts, secular Gothic surrendered its claims for ever. That was a magnificent sentence; but if he were to say ecclesiastic Classic surrendered its claim for ever, one would be just as true as the other. It was infinitely too magnificent and too epigrammatical to be capable of truth. He did not go in for "for ever;" he only went in for twenty years. Now he came to another matter, which he was rather sorry to hear, for it did not occur to him to be just, nor did it seem to him to be logical. It was that Mr. Burges was deficient in power because he was called "Billy." No doubt Mr. Burges was christened "William," and undoubtedly if he had been christened Richard that might have led to his being called "Dick"; but, whether he were Billy or whether he were Dick, he was rather surprised to hear Professor Kerr predicate that want of power in the great genius—for he was a great genius. He always felt it a moral and artistic duty to stand up for him. In his great good-nature, in his *bonhomie*, and his extraordinary fun and wit, he very often did not do justice to himself. He was too real and natural himself to pose for posterity, therefore posterity must stand

up for him, and say that this laughing chaffing fellow was a man of great power. He might tell them an anecdote that occurred during the competition for the Law Courts. He, Mr. Hope, knowing what sort of fellow he was made him promise to abstain from any jokes. Meeting him, Burges said: "I have been very good; the only joke I made was to put the Recording Angel over the Record Office." One day he was looking at Burges's drawings when a friend came in, and, flicking the drawings, said, "I would not mind being beaten by those," and the man who said that was Street. Burges's drawings were a noble set, and it was a great credit to Street to have had the Law Courts assigned to him with such a magnificent series of drawings as Burges's in competition. In conclusion, Mr. Hope said that the whole paper was a very brilliant one and a good-humoured one, and, above all, it was, as Professor Kerr had said of the future of ecclesiastical Gothic, and, as for the other, it was a recantation—not at all complete, but still a recantation quite sufficient for him, and very refreshing—of the old doctrine of the Donaldson and Cockerell and Basevi school.

Mr. J. P. SEDDON proposed a vote of thanks to Professor Kerr. In the matter of prophesy, the magnificent mountain had brought forth only a mouse. The whole history of architecture, and of what Christian architecture had done, was simply ignored, and they learned that the style of thirty years hence would be but another version of Queen Anne. That was a very lame conclusion to come to. He could not believe in the decay of Gothic, seeing the voluminous examples given by the press of Gothic work being carried out in all parts of the country, and seeing that the young architects were more than ever studying the principles of the Gothic style. If there was anything good in Queen Anne, which it was said had superseded Gothic, every atom of its goodness was Gothic. In Mr. Norman Shaw's work, with the exception of the crinkle-crinkle work, it was Gothic. Queen Anne style was but a step or two removed from Renaissance; it only wanted a little more false art to make it quite Renaissance. The grand Gothic principles of proportion could never be put aside or ignored, and, if they wanted to know how the minor arts were thoroughly welded into architecture, they must look back to the past ages of Gothic for it.

Mr. AITCHISON seconded the vote of thanks. With the conclusions Professor Kerr had come to on many points, Mr. Aitchison said he agreed. Though no one could be a greater admirer of Gothic than he was, no one could help seeing that at present it had ceased to make the slightest progress. What was called Queen Anne had been to a great extent a return to a form which the nation, and all nations of Europe, were more accustomed of late years to use, put on to the irregularities of Gothic form. What they had to look forward to was that material which had really had more to do with the extinction of Gothic than anything except painting and sculpture. One of the great things about Gothic was that it was an adaptation of art to new forms of construction, and that gave it its vitality, and spread it throughout the world. It solved problems of construction which the ancient Romans could not solve with all their power. Nowadays these problems had mainly ceased to be carried out except in iron, and in iron they would have to look for one of the great arts of the future, and, as he believed, it would become the architecture of the future. If it were to form an architecture that would not simply be construction, architects must learn the art of architecture in iron.

The CHAIRMAN said that Professor Kerr had touched on the question of competitions in the future. He (the Chairman) wished to say this word in regard to the position he had taken up towards the question, and it was to say that he had never at any time expressed an opinion either for or against the system. He was rather against the system as a matter of fact; but as regards his action his aim had been to try and improve matters, and secure that they should be conducted as fairly as possible.

The vote of thanks was then passed unanimously.

Professor KERR, in replying, said that he was very much obliged to Mr. Beresford-Hope for the dissertation with which he had favoured them on his paper. In old times, in the battle of the styles, he was on one side and Mr. Beresford-Hope was very emphatically on the other side; and as Mr. Hope told them that he had recanted of the thought he then entertained, it seemed to him that he (Professor Kerr) was right, because he had now taken a *via media* which Mr. Hope recognised, though he would not admit it. But the *via media* was a diagonal induced by two forces. In fact, during the last twenty years he had got a little wiser, and Mr. Hope had not.

Mr. BERESFORD-HOPE: Speak for yourself.

Professor KERR said that at all events he was much obliged to the meeting for the patience with which they had listened to him. He was perfectly satisfied with the criticisms which had been delivered, and with which he agreed entirely.

Mr. DYCE CAY, C.E., has prepared plans for the extension of Arbroath Harbour, at an estimated cost of 150,000*l*. The scheme includes the construction of two breakwaters, each about 2,000 feet long, carrying out the entrance into deep water, and enclosing the present harbour works.

## SALE OF NOTABLE PICTURES.

ON Saturday last Messrs. Christie & Manson sold at their rooms a collection of pictures, one having a romantic history. The picture is known as *The Monarch of the Glen*. It was painted by the late Edwin Landseer, R.A., for the refreshment-room of the new House of Lords, and was tendered to the Fine Arts Commission at the price of 300*l.*, and was rejected. Sir Edwin received a note from the secretary stating the fact of the rejection of the picture, and requesting him to send for it, as it was in the way. Sir Edwin was indignant, not only at the insult in rejecting his picture, but also at the curtness of the note demanding its removal. This was in 1851, when any painting by Sir Edwin commanded a ready sale at much larger prices. The picture was at once sold to Lord Londesborough for 800 guineas, and the copyright to Mr. Henry Graves for 500 guineas. The picture has not been seen since it was in the old rooms of the Academy in Trafalgar Square, as it was not obtained for the special exhibition of Landseer's works after his death, formed at Burlington House in 1874. But it is so well known by the masterly engraving by Landseer's brother Thomas, that scarcely a word is wanted to describe the beautiful subject. It is enough to say that a noble stag, crowned with his twelve tines, stands among the clouds on his throne of rock and heather, proudly rearing his head in the mountain air, breathing defiance to all rivals and all enemies. His quick ear has caught a sound, and he seems with those wide open nostrils to scent some danger from afar. The picture was painted with all the fire of Landseer's best moments, and he did it as a test piece of his powers, for it was intended to fill a panel, which explains its square form, in the House of Lords, in those days when it was thought feasible to find pictures by English artists worthy to decorate the National Senate House, and when our leading painters were invited to offer works suitable for the purpose. On Saturday it was bought for 6,510*l.* by Mr. Eaton, M.P., who bid for himself and led a gallant contest with Messrs. Agnew. The picture is in as brilliant condition so far as colour goes as the day it was painted, but substantially it is covered with those serious expanding cracks inevitable to the method which Landseer persisted with many other painters of the time in using. As to the price now obtained for it, it is interesting to recall former great prices of which this is a very close rival. The famous *Otter Hunt* sold in Baron Albert Grant's sale, 1877, for 5,932*l.* 10*s.*; the chalk drawing or cartoon of a *Stag pursued by a Hound*, in Mr. Coleman's sale, for 5,250*l.*; and the *Well-bred Sitters*, 5,250*l.* *The Bears*, in the same sale, brought 6,615*l.*, the highest paid at auction for a Landseer, but not the highest paid, for we know that Lord Brownlow's famous *Titania*, so beautifully engraved by Cousens, was recently sold through Messrs. Agnew for 7,000 guineas to Mr. Quilter. As much as eight or ten thousand had been named as the probable price of *The Monarch* before the sale, and it has since become known that Mr. Eaton was prepared to advance very considerably above the sum he has now given for the picture.

## THE EDINBURGH ARCHITECTURAL ASSOCIATION.

UNDER the conductorship of Mr. Archibald Macpherson, architect, the members of this society visited Dalhousie Castle and Newbattle Abbey on Saturday afternoon. Dalhousie Castle was reached about half-past two, and, after viewing the exterior of the baronial pile, the party proceeded to the hall, where, in the course of a short paper descriptive of the castle, Mr. Macpherson said that from the plan of the buildings—which offered the most reliable evidences of antiquity—they were able to identify the outline of the present edifice as almost precisely that of the outer defences of a stronghold of the thirteenth century. It presented then the appearance of a fortified court, more or less square in form, surrounded by massive walls, crowned with machicolated battlements, and further defended at one angle by the massive round tower still existing. There was reason to believe that a similar tower at one time stood at another of the angles. These towers commanded the approaches to the barbican. Other smaller turrets were to be found at intervals along the battlements; while within the court fronting the barbican stood the donjon and keep. It was probable that in the sixteenth century the keep or house proper was greatly modified, and that in the seventeenth century other changes were made, the main body having by that time assumed the form of the letter L, which was characteristic of the houses of the time, especially in the vicinity of Edinburgh. The castle was burned down about ten years ago, and further additions and alterations had been made since then. Proceeding by way of Dalhousie Gardens, the party reached Newbattle Abbey about four, and there a short and extremely interesting paper on the Abbey was submitted by Mr. Macpherson. He stated that it was at one time a Cistercian monastery, founded in the twelfth century. The excavations made by the directions of the present Marquis of Lothian six years ago laid bare the founda-

tions of the church and a portion of the walls of the conventual residence. From an examination of the details thus found, it was evident that there had existed from the date of the foundation a church of transitional character, and that, having been destroyed by fire, it was replaced by one built in the fourteenth century. That theory was fully corroborated by the fact that Newbattle shared the fate of the other churches when in their inglorious expedition Richard II. of England and his uncle John of Gaunt destroyed churches and abbeys, but left the castles intact. The church, which consisted of nave with aisles, short transepts, and square-ended apse, measured from east to west 239 feet in length, 57 feet in breadth, including aisles, and 113 feet in breadth across the transepts. It nearly equalled in measurement its mother house—Melrose. A few interesting facts about the mansion-house were also given. Votes of thanks were passed to the Marquis of Lothian and the Earl of Dalhousie for permitting the Society to visit their residences, and to Mr. Macpherson for the valuable information he had submitted.

On Monday evening, at the usual fortnightly meeting of the Association, Dr. R. M. Ferguson delivered a lecture on "Electric House-fittings."

Viollet-le-Duc.

SIR,—I hope you will favour me with space in your columns to express my deep sense of indebtedness to the Council of the Royal Institute of British Architects for allowing me to take part in the Conference of last week, and also to thank the members as a body for their more than kind reception of my paper on "Viollet-le-Duc."

No fitter place or audience could have been found for some mention of the genius and work of a man who was one of the last to say a word in praise of himself. I know that Viollet-le-Duc held his English compeers and British architects generally in high esteem; and he never forgot that he was the honoured recipient of the gold medal of the Institute, which is now among the treasured heirlooms of his family.

It would require not one, but half a dozen papers to give an adequate presentment of his capacious intellect, but my main object will be served if I should in any way be the means of inducing the younger members of the architectural profession, not merely to copy his drawings, instructive and beautiful as they are, but to study writings so pregnant with practical suggestions.

I received a fortnight ago a letter from his son expressing his regret that it was not in his power to send for exhibition at the Conference a collection of the more important of his father's larger drawings, which are no longer his, but the property of the French nation, and are now being arranged for permanent hanging in the Salle Viollet-le-Duc at the Trocadéro, adjoining that fine museum of French historical sculpture which owes its origin to him, and was the latest fruit of his prolific life.

Yours obediently,

West Grange, Stroud:

CHARLES WETHERED.

May 12, 1884.

P.S. In my paper for "Mr. Hamilton" read "Mr. Hamerton," and for "M. Baudot" read "M. de Baudot."

## Competitions-Memorial Committee.

SIR,—We enclose a copy of a circular which we intend forwarding to the promoters of any competitions we may hear of. We trust you may find space for this in your journal.

Yours obediently,

(Signed)

COLE A. ADAMS,

ASTON WEBB,

} Hon. Secs.

14 Holden Terrace, Grosvenor Gardens, London, S.W.:

May 13, 1884.

GENTLEMEN,—The committee appointed by the Royal Institute of British Architects, with a view of impressing upon promoters of competitions the importance, both in their own interest and in that of the architectural profession, of appointing a professional assessor of established reputation in all cases to advise the committee of selection on the designs submitted, having heard that you propose to obtain designs for your new building by means of a competition, beg respectfully to urge upon you the appointment of a professional assessor to advise you, for the following reasons:—

Because it requires the knowledge and skill of a specialist of great experience to weigh the merits and demerits of rival designs, and to decide on their suitability for their intended purposes and for the site.

Because designs are unfortunately often submitted in competition which are in violation of the conditions; while others, if executed as designed, would largely exceed the sum at the disposal of the promoters; while, again, a design in many ways inappropriate for the purpose may be submitted. In all such cases professional advice would be invaluable to promoters, saving them from possible litigation, and from incurring

unnecessary expense, or the lasting inconvenience of erecting a building unsuitable to its purpose.

Because the not unnatural tendency of an architect competing for a building is often to underrate the cost of his design, while a professional assessor approaches the question in a more impartial manner, and his judgment is therefore more likely to be the right one. He will also better be able to gauge from the designs (an all-important matter) whether their authors show competency in design, general arrangement, and construction.

Because by the appointment of a professional assessor you will not only be assisted in the selection of the best designs, but you will also enable many good men to compete who would not otherwise be able to do so.

Because the number of architects agreeing not to take part in any public architectural competition, unless one or more professional assessors of established reputation are appointed to advise the promoters on the relative merits of the designs submitted in the competition is upwards of 1,350, and the list contains the names of most of the best known men in the profession. Such an expression of opinion will, it is hoped, have weight with yourselves and other promoters, who are frequently placed in an invidious position by the powerful influence which may be brought to bear by unscrupulous competitors, and by other means, where there is no assessor, which would be to a very great extent removed by the appointment of one.

Because promoters would find great advantage in securing the services of an assessor, as an initial step, to assist in drawing up the conditions of the competition, and announcing his employment when advertising the same.

This committee does not attempt to advise promoters on the selection of an assessor, but would refer them to the President and Council of the Royal Institute of British Architects, 9 Conduit Street, Hanover Square, London, W., or to any well-known architect of established reputation, not necessarily a member of the Royal Institute of British Architects, who is not a competitor.

The selection of an assessor or assessors should be to a large extent governed by the nature of the proposed competition, the object being to obtain the services of men most conversant with the requirements of the class of building contemplated.

The suggestions for the conduct of architectural competitions, published by the Royal Institute of British Architects, which are enclosed, will be found very useful for the guidance of promoters, but this committee does not recommend the double competition system when the amount to be expended is under 20,000*l*.

We remain, gentlemen, your obedient servants,

COLE A. ADAMS, } Hon. Secs. of the  
ASTON WEBB, } Committee.

#### Stock Exchange.—East Addition.

SIR,—Referring to your notice in last week's issue of the Conference of Architects' visit to this building, you will oblige by stating that the Pavonazetto and other marbles, including chimney-pieces, were supplied by us, and we are also executing the carvings, exterior and interior.

Yours, &c.,

FARMER & BRINDLEY.

67 Westminster Bridge Road, London, S.E. :

May 14, 1884.

#### GENERAL.

**A Marble Statue** of the Queen has been purchased and presented to the town of Birmingham by public subscription. The statue is a companion to that of the late Prince Consort, and has been executed by Mr. Woolner.

**Mrs. Gladstone** will, on May 19, preside at an interesting gathering in the new studio of Mr. Adams Acton, the sculptor, whose energetic wife (in association with many of the leading ladies of St. John's Wood) has arranged to hold a bazaar of an artistic character, with the environment of her husband's Classic studies, in aid of Mrs. Gladstone's Convalescent Home. The success of the amateur plays which were recently enacted there on behalf of the same charity has kindled fresh enthusiasm on its behalf, and given great encouragement to the workers of the "Sunnyside Bee," founded by Mrs. Adams Acton. Lady Frederick Cavendish will preside on May 20.

**The Bequest of the late Mr. John Newton Mappin** to the town of Sheffield consists of 136 catalogued pictures and some half-dozen which were bought too late to be included in the list in the possession of the owner. The executors have resolved that the works shall not be made public till after they are placed in the gallery to be built for their reception, for which purpose Mr. Mappin left a sum of 15,000*l*. It has been decided to build a gallery adjoining the Western Museum, to consist of several rooms. The collection consists of works by the following artists amongst others:—E. Armitage, R.A., Rosa Bonheur, Boughton, J. P. Clays, J. Constable, R.A., David Cox, T. Creswick, R.A., E. Crofts, A.R.A., John (old) Crome, L. Dansaert, H. W. B. Davis, R.A., W. C. Dobson, R.A., Thomas Faed, R.A., Copley Fielding, Edouard Frère, W. P. Frith, R.A., Frederick Goodall, R.A., Sir Edwin Landseer, R.A., Cornelius van Leemputten, Roland Le Fevre, John Linnell, sen., J. T. Linnell, William Linnell, Jutzens,

J. E. Millais, R.A., G. Morland, W. G. Mückley, W. Müller, L. Muntz, Patrick Nasmyth, Erskine Nicol, A.R.A., W. O. Orchardson, R.A., J. Pettie, R.A., J. Phillip, R.A., David Roberts, R.A., Clarkson Stanfield, R.A., Marcus Stone, A.R.A., G. A. Storey, R.A., J. M. W. Turner, R.A., E. M. Ward, R.A., and James Webb.

**Mr. Ewan Christian**, architect to the Ecclesiastical Commissioners, examined on Tuesday the plans of the St. John's site for the proposed cathedral for Liverpool, and expressed the opinion that it was a most excellent site for a building which would be a credit to Liverpool; in fact, he hardly knew one superior to it in England.

**Mr. J. M. Dick Peddie**, architect, of Edinburgh, read a paper on Monday evening before the Society of Antiquaries of Scotland, describing the old timber house at the head of the Lawnmarket, recently pulled down. Mr. Peddie, while lamenting the necessity which existed for the demolition of this typical specimen of an interesting class of buildings once common in the city, was glad of the opportunity of investigating its construction, which did not seem to be quite clearly understood. By the aid of a large number of carefully-prepared drawings, plans, and sections, he went minutely into the details of its construction, showing that it was not a building of stone faced with wood, as had been supposed, but a building wholly of wood above the street front, with open galleries giving access to the various rooms. He also referred to a rather fine example of a painted ceiling which it had contained. Mr. MacGibbon, Mr. George Seton, and Mr. Burnett, Lyon King-of-Arms, followed with some remarks on the interesting features of the structure and the ceiling, which was compared with those at Linlithgow, Earlshall, &c.

**Baths and Washhouses, Newcastle-on-Tyne.**—Mr. Picton, F.S.A., of Liverpool, who was appointed by the Newcastle Corporation to decide upon the plans sent in for the erection of baths and washhouses in Scotswood Road, Byker, and Arthur's Hill, has announced his award as follows:—For the Scotswood Road site—(1) Messrs. Gibson & Allan, Newcastle-on-Tyne; (2) Messrs. Clark & Moscrop, Darlington; (3) Messrs. Tate & Popplewell, Manchester. For the Byker site—(1) Messrs. Gibson & Allan, Newcastle-on-Tyne; (2) Messrs. Clark & Moscrop, Darlington; (3) Mr. T. W. Dyson, Newcastle. For the Arthur's Hill site—(1) Messrs. Gibson & Allan, Newcastle-on-Tyne; (2) Messrs. Clark & Moscrop, Darlington; (3) Mr. Alfred Darbyshire, F.R.I.B.A., Manchester. The cost, exclusive of sites, not to exceed 24,000*l*.

**International Health Exhibition.**—Among the handbooks published by Messrs. William Clowes & Son, Limited, of Charing Cross, the following appear:—"Healthy Villages," by Dr. H. W. Dyke-Acland, C.B., M.D., F.R.S.; "Healthy Bedrooms and Nurseries, including the Lying-in-Room," by Mr. Gladstone; "Healthy and Unhealthy Houses in Town and Country," by Mr. William Eassie, C.E., with an appendix by Mr. Rogers Field, C.E.; "Healthy Furniture and Decoration," by Mr. Robert W. Edis, F.S.A.; "Healthy Schools," by Mr. Charles Paget, M.R.C.S.; "Health in Workshops," by Mr. James B. Lakeman; and a "Manual of Heating, Lighting, and Ventilation," by Captain Douglas Galton, C.B., F.R.S.

**Glasgow Architectural Association.**—The ordinary monthly meeting was held last week, the vice-president, Mr. Henry Daldie, in the chair. A paper on "Italian Gothic" was read by Mr. Alexander McGibbon, illustrated by photographs, prints, and chalk diagrams. Without by any means giving unqualified praise to the style, the essayist yet considered that many of its most characteristic features were suitable for adaptation to modern requirements and the materials at hand, more particularly as regards its system of polychromatic decoration, which might legitimately be applied to our own street architecture.

**Grimsby.**—New schools are about to be erected at Great Grimsby for the Clee with Weelsby School Board, to accommodate 500 children, from the designs of Mr. E. W. Farebrother, A.R.I.B.A., architect, Grimsby.

**The Bradford Corporation** have decided to purchase land in Chapel Lane for the proposed erection of additional municipal buildings.

**Messrs. Wheatley & Cridland** will, on May 20, hold an important sale of mosaics, encaustic floor and wall tiles at Hamworthy.

**Messrs. Powis & Co.**, contractors, of London, who have an action against the Leamington Corporation of long standing, have filed their statement of claim, in which damages are laid at 17,000*l*. The action arises out of the contract they had for completing the waterworks. The Council have a counter-claim against the plaintiffs.

**The Engineering Department** of the Yorkshire College at Leeds is about to be enlarged, to admit of more students at the classes, and towards this object Sir Andrew Fairbairn, M.P., and Sir John Hawkshaw have each contributed 1,000*l*.

**The Wolverhampton Corrugated Iron Company** have just supplied the whole of the galvanised corrugated iron for the Wolverhampton Exhibition.

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, MAY 17, 1884.

### TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”*

### COMPETITIONS OPEN.

**BURNLEY.**—July 1.—Plans are required for the Erection of Municipal Buildings, Police Courts, and Baths. Premiums of 200, 100, and 50 guineas. Mr. J. E. Stafford, C.E., Borough Engineer, Burnley.

**DERBY.**—June 2.—Designs are required for the Erection of a Pauper Lunatic Asylum for the Borough at Rowditch. Premiums of £100, £75, and £50. Mr. Thomas Coulthurst, Borough Engineer, Full Street, Derby.

**LILANELLY.**—May 31.—Plans are required for a School in Three Departments (Boys, Girls, and Infants). Mr. J. Jennings, Clerk to the School Board, Lilanelly.

**SUNDERLAND.**—May 19.—Designs are invited for Laying out Twenty Acres of Land, the Mill Farm and Broad Meadows, Durham Road, Sunderland, for Villas, Terraces, or Street Rows, with Sewerage, &c. Premiums of Thirty and Twenty Guineas. Messrs. Duncan & Duncan, Solicitors, 3 Market Place, South Shields.

# The Architect.

## THE DOME OF THE FUTURE.

HE dome has always had a mystery about it, whether artistically or scientifically regarded, and the higher criticism of architecture, when it used to be more cultivated than it is now, has again and again turned, with a kind of affectionate apprehension or apprehensive affection, to some new study of the subject. The late Professor COCKERELL, in that pedantic way which was so charming with him, would in his Academy lectures dwell almost ecstatically upon the theme; and his admiring young audience would

take it as a personal compliment when he went so far as to tell them of "the dome that crowns the human form divine." Sir GILBERT SCOTT, occupying the same platform many years after, made one of his strongest points when he claimed for the Gothic style an equal æsthetic interest in the dome, which some thoughtlessly supposed to be but a commonplace Classic or neo-Classic feature. MICHAEL ANGELO considered that he was pursuing vaulting ambition to the very zenith when he boasted that the dome of the Parthenon should be elevated upon the summit of St. Peter's. Our own Sir CHRISTOPHER WREN none the less admired himself, doubtless, and admired his art, when he upraised into the not then so dirty air the bright and graceful, if hollow, crown of his Cathedral of London City. And we may perhaps be permitted to add that, if the Liverpool people of to-day, in resolving to build for themselves a modern cathedral upon such great lines as shall be worthy of the dignity of their boasted wealth, should take the hint to try what can be had in the nature of a dome once more, whether Classic or Gothic, the way is open to them still to do quite as well as WREN did, and perhaps a good deal better.

Mr. EMERSON, who has had a considerable amount of experience in the design of modern Indian building, submitted to the Institute of Architects on Monday evening some highly interesting observations on the character and construction of Oriental domes, and, indeed, of domes in general, from that of the Taj Mahal to that of St. Paul's. Such is his admiration of the noblest integer of architectural design that he even permitted himself to ask whether, in the new style, more muscular and modern, which we are beginning to hope it may be the task of English architects to conquer in the early future, it might not be well to regard the dome as capable of giving a specific direction to the efforts of intellectual ingenuity. The walls of the lecture-room being well covered with drawings of domes of all kinds, the opportunity was accepted for what turned out to be almost a debate on domes, in which it was, however, to be regretted that so few were present to participate.

Amongst the rest, when the dome of St. Paul's became a subject of attention, it will not surprise some of our readers, perhaps, so much as it did a section of the meeting, that the well-known discord which prevails between the outside and the inside of the structure was somewhat pointedly animadverted upon. Critics pretty well understand nowadays that the "dome" in this case is not a dome at all, but a graceful round-roofed tower atop of a dome. Still it was to the credit of the meeting as regards British patriotism that the denunciation of its character as a sham dome—which there can be no doubt the architect only too solemnly intended it for—should be repudiated earnestly. That the inner dome—the only real dome—is of a proportionate height within, while the outer dome—the lead-covered empty roof of timber 50 feet higher—is of a proportionate height without, was pronounced by the President himself amongst others to be enough to satisfy criticism. It depends upon what criticism is; but we will take leave at least to say that if the English dome of the future is to rear its head as loftily as the cupola of WREN, and to be as empty withal of intellectual furnishing within, the coming architect of it may safely be advised to beware of the opinion, for once in a way, of the British artist and the British Philistine combined.

The most interesting subject of discussion was the con-

struction of domes, not, of course, with the misplaced ingenuity of WREN, but on the more honest and more simple principles which all the other examples on the walls illustrated, and which obviously had constituted the very test for their admission as illustrations. One of the most suggestive of the drawings was the section of a dome at Baroda constructed by Mr. CHISHOLM, another Indian architect who was fortunately present to speak for himself. The dome is what is called a double one. The structural dome is very sharply pointed; and the outer cupola, resting upon this at springing and summit, follows the bulbous model of the east, so as to leave a narrow interval between the two. Both vaults are of the lightest construction, and there is no lantern. The interval between an outer and inner skin in this way is, as we all know, a question of weather-protection, and in a hot climate, as was well explained, it serves also a most essential purpose in respect of ventilation. Upon this example it was pointed out that the high-pointed section is in reality almost the first essential to a strong dome; it might have been added that the absence of the lantern in Oriental domes is again an essential element, both in their durability and in their facility of construction. It must be borne in mind that the eastern dome-builders use no centering, or almost none; and it is easy to see that this constitutes indeed a criterion of true dome-building.

The use of cramps, chain-bond, or other metal-work in a hot climate was fully discussed; and so far does this seem to be a question for anxiety that Mr. CHISHOLM had an ingenious proposal to submit for using a wrought-iron framework to serve as a tie at the springing level, having balance weights to rise and fall with the changes of temperature. Obviously this could not be called architecture, and the best impression it was calculated to leave upon the mind of an expert went rather to show how needless all such contrivances are if the constructor will but confine himself to the principles proper to the case. A dome requires no tie of any sort except that of good masonry. Every one knows that the most skilful equilibration of the vault of a great bridge furnishes but the theoretical basis upon which an immense margin of stability is created by the mere manipulation of the bond; and just so is it in the dome—indeed the adventitious help of such artifices is here even much more effectual. But it must never be forgotten that a dome commonly so called is not a dome merely because it is of rounded outline; it is a dome, whether in art or in science, only when it is a circular vault of simple building; and then it possesses, beyond all rivalry, the grandest capabilities which the whole range of constructive science offers to the ambitious architect.

It is well understood that modern architects are timorous in two ways: first there is the hereditary narrowness of mind which has been brought about by the dissociation of their structural work from that of the engineer; and, secondly, there is the constant fear of expense. Say what we will of the merits of scientific administration, there can be no doubt that the bugbear of economy—really parsimony—is one of the most serious of all obstacles to the practice of substantial and stately building. It is quite in accordance with this state of things when we find those who have in some degree grasped the idea of dome-building on a large scale—as very few have—turning at once to secret iron ribs as a cheap solution of the problem, as if a dome were no better than an umbrella. The Vienna Exhibition roof, alluded to in the discussion, and unquestionably a great success if only on account of its magnitude, is not a case in point. It was not a dome so much as a grand conical roof of the most characteristic iron framing throughout; and so far it may be regarded as the model of what a dome in iron ought always to be. But it may be truly said that the very essence of such a design—and of course the converging ribs may just as well be curved as straight—lies in the exposure to view of the whole of the ironwork. Something was hinted by one of the speakers about such ironwork being regarded as a skeleton, to be covered, as nature covers the skeleton of an animal, with entirely different material in entirely different form; but it is not necessary for the architect to go even so far as this before he becomes chargeable with sophistication. When, for instance, a domed structure of iron ribs is filled in with panels of concrete slab, we doubt whether this can be regarded as a dome in any sense; it is rather a ceiling, with no matter what outside to keep off the weather; and the concrete slab may just as well be papier-maché, and the ironwork all the slighter, and all the cheaper. Perhaps the best ideal of an iron dome

would be a circular vault-roof—either Classic or Gothic—of the greatest possible extent, the ironwork appropriately ornamented and fully exposed without and within, and the whole surface filled in with dark painted glass; and no doubt such a structure might be made as majestic and glorious in its way as any work of building need ever be.

It may perhaps be suggested whether concrete, not previously prepared in slabs but used plastic, might be employed with advantage in dome-building. Some such mathematical principles being adopted as those which were some years ago expounded by Sir EDMUND BECKETT, the only question for anxiety would be how to make the structure light enough and yet strong enough. The whole dome would be a single inverted cup, and if it failed at all it would simply become fractured in one of two ways—either vertically at the weakest point of equilibration by means of outward thrust, or laterally at a similar point by reason of what is the same thing in effect, the settlement of the crown. The Oriental domes, it is said, exhibit fractures of such a kind in many instances. Even the dome of St. Peter's, as all the world knows, has its cracks that must be watched from year to year. Chain-bond, we need scarcely observe, may overcome all risks. But the whole subject, the more it is discussed, may be said to grow the more interesting to the architect, and the more promising in the direction of magnificent building yet unknown.

#### EXHIBITION NOTES.—THE ROYAL ACADEMY.

THE annual picture show of the Royal Academy is remembered for very various reasons. Sometimes it is fixed in the mind by recollections of certain pictures that have taken the public by storm, for good or evil report, and stirred a strife of tongues that has lasted a whole season and more. Sometimes we record the exhibition because it was so bad, sometimes because it was so good, sometimes because it was neither one nor the other, but only "average." Now the exhibition of this year partakes of all these means for remembrance. In the opinion of no doubt a large number of persons, Sir F. LEIGHTON's large picture, *Cymon and Iphigenia*—on which we commented in "Studio Notes"—is an eventful picture, a picture that marks an exhibition. At any rate, we all know that it has been purchased by the Fine Art Society for a very large sum, for the purpose of reproduction; therefore, from what may be called the point of view of the picture market, we may consider *Cymon and Iphigenia* "eventful." Certainly this somewhat pretentious work looks better at Burlington House than in the studio. Then there is the large canvas by Mr. ALMA TADEMA, R.A., *Hadrian in England*. We do not get a picture on this scale from Mr. TADEMA often, and are prepared with a welcome. Unfortunately, however, the painter is not at his best this time. There are all the perspective "dodges," the illusive vistas and realism of constructive facts, the eccentric defiance of ordered composition, the accidental introduction of the figures—here a head and there a leg, and there a whole form—and there is a great amount of archaeologically accurate and beautifully painted detail. But for "a' that, and twice as much as a' that," the picture is not interesting, and HADRIAN and his suite at the top of the open staircase, spite of imperial purple and correct accessories, are not vital personages. The attendant bringing up a tray of specimen pots from below, and whose head and shoulders appear abruptly half-way on the stair, does not serve the purpose of projecting the foreground with a force that shall send into truth of distance the glimpse of the potteries seen far below. It has been irreverently remarked that the scene looks rather like the visit of a noble "taster" going the round of the early British club-houses. The waiter of the period brings up the soup, the cook's seasoning shelf is palpably revealed in the bracket with the onions on it, and down below the menials of the kitchen are hard at work preparing savoury messes. Mr. TADEMA is so successful a painter, and so sure of the respect due to his great talents, that he may without discomfort bear such *persiflage*.

Two Academicians of long standing as public favourites have done well this year, first, Mr. GOODALL, R.A., in a brilliantly-painted interior, *A New Light in the Harem*, of which the motive is the delight of a languid Eastern mother in watching the infantine graces of her first-born, laughing and

kicking on the floor in genuine babyish fashion. Also in a scenic but impressive canvas, on large scale, depicting the *Flight into Egypt* by solemn moonlight. Then Mr. THOMAS FAED, R.A., shows the stronger side of his domestic style in the picture of a lonely little girl, gazing into the fire, building up a child's castle in the air. *Of what is the Wee Lassie Thinking?* says the title, and the suggestion is artistically expressed in the figure, which has the merit of being well placed upon canvas and soundly painted.

The group of painters who have made Venice their headquarters, and the incidents of modern Venetian life of the people their subject-matter, CECIL VAN HAANEN, HENRY WOODS, A., and DE BLAAS send some exceedingly clever pictures. Mr. WOOD's work has, to our thinking, most charm, for the poetry of Venetian backgrounds and Venetian atmosphere enters into his scheme. VAN HAANEN is the most indubitably safe in his audacities of scintillating colour and complexities of line, while DE BLAAS shows an individual *chic* in his treatment. To the group a new aspirant for brotherhood appears in Mr. LUKE FILDES, A., whose single figure study of a *Flower Girl*, and large subject-picture called *Venetian Life*, a coterie of laughing, gossiping work-girls, plying their various avocations in the shade of an archway beside a canal, have both the motley palette and surface epitome of character in type and action that belong to the style, but by no means the skilful harmonies or studied relations of line which underlie what looks to a casual observer merely clever chance work. But Mr. FILDES is for his best advance too facile of brush and of artistic mind. Unless he will turn mentor to himself, and correct his draughtsmanship and paint with greater conviction, he will never rise above his present level. One outsider who has made deliberate advance year by year obtains this season something like a triumph of recognition. This is Mr. WATERHOUSE, who into his subject—a number of Oriental women squatting in a half-circle before a human head, or "teraph," *Consulting the Oracle*, which a female diviner seeks to hear from the dead lips—has put such well-considered skill into the drawing of expressive attitudes and heads, into the assortment of brilliant colours and rich fabrics, in the painting of curious detail, in the harmonising of all within the luminous shadow of a room shrouded from midday glare by lattice-work and blinds, that a large section of the art-loving and knowing pronounce this picture to be the picture of the year. There is certainly no more thorough and artistic work. Another admirable painter is Mr. SEYMOUR LUCAS, whom the Academy have looked upon with favour under the purchase powers of the CHANTREY Bequest, by buying *After Culloden—Rebel-hunting*. Troopers make sudden entry into a smithy, and interrupt three stalwart and defiant men of the forge in act of making a new shoe for the horse of a fugitive rebel. Mr. LUCAS has never done better work than in the study of these manly sons of VULCAN, and the whole thing, from the narrative point, and for sound, crisp technique, is capital.

In the way of decorative or ideal art not much is to be found. It is, however, a hopeful sign of the times that Mr. A. MOORE's large decorative picture, *Reading Aloud*, which we noted in speaking of the Grosvenor Gallery, should have been assigned a good place on the line; but we see no indication of any competition with the painter in art of this *genre*, although of subject easel pictures, treated with a view to their place on the walls or in the panelling of a room, there is no lack. Mr. LINTON exhibits the last in appearance, but the first in serial order, of his pictures illustrating the career of a soldier in the Middle Ages. *The Declaration of War* shows a Venetian prince refusing with scornful gesture the terms of some Oriental potentate, whose long-robed envoys bow before the dais in dignified acquiescence. Beside the prince stands the knight whose subsequent wars and triumphs form the subject of the series. In some respects this picture is the best of the set, satisfactory in composition, with more of life and less of the lay figure in the *dramatis personæ*, and excellent in the arrangement of variegated and isolated colours. Mr. LINTON at any rate paints with a purpose. He is in earnest over the narrative setting forth of his motive, but never forgets the work of the artist in the office of the story-teller.

Mr. POYNTER, R.A., is the only painter within the Academy who sends a study of the nude *Diadumenè*, a figure on a small scale, solidly and brilliantly painted, with elaborate architectural background. Mr. POYNTER's other contribution is a portrait—and a very ill-favoured one—of Dr. Barry, Bishop of Sydney. Portraiture, of course, is liberally accommodated on the walls,

for here a double power works on the committee of selection ; first, there is the honour due to the artist, and next the honour due to his subject. Sometimes, however, an accident will close doors on both issues, and we are sorry this has been the case in Mr. WILFRID LAWSON's excellent portrait of *The Speaker*, which on both counts might have been thought safe of entrance. By another untoward circumstance the chief picture of the year from the studio of Mr. WATTS, R.A., *Love and Life*, arrived too late for the Academicians' sending-in day, and the arbitrary rules of the body could not be broken, even for one of their most important members. Let outsiders take heart of grace ! Even one of the sacred forty has to bow to fate. To return to portraiture, there is the broad and simple treatment which concentrates all power into the portrayal of the individual, without anything in the way of decorative accessory or elaboration of background. Mr. MILLAIS, R.A., in his portraits of men, Messrs. OULESS and F. HOLL, and, "with a difference," Mr. HERKOMER, are masters in this mode, mostly painting men, and giving strong character study, with more or less artistic management, and more or less vigorous technical excellence. Mr. OULESS's diploma portrait of his brother Academician, *Mr. Hodgson*, is a capital instance of this style of portraiture. Then there is the fancy domestic mode, as when Mr. JOHN COLLIER paints, in a very "cheeky" way, the three *Daughters of Colonel Makins, M.P.*, having a game of romps, one sister prone on the floor, while the others pelt her with flowers ; or the simple domestic treatment, as in Mrs. L. STARR's graceful and beautifully-painted portrait of *Lady Nicholson*, in a red plush dress, seated at a library table, with tasty knick-knacks about and carved panelling behind, or many of Mr. SANT's drawing-room pictures of ladies and children. And there is the portrait in character, a style in which Mr. PETTIE, R.A., has from time to time done some excellent bust studies, turning out his friends in the guise of warriors or nobles of past days, when men clothed their persons to greater advantage for dignity and picturesqueness. In ladies' portraits, too, we get something fanciful as well as faithful, by clever use of the costume of the period in its prettier aspects, as in the *Portrait* of HENRIETTA MONTALBA, by her sister ELLEN, in white satin, with the long dark hair hanging in a long plait, or *Mrs. John Rose*, by R. J. GORDON, in a sort of shot-red pinafore dress. Yet another treatment may be cited at risk of wearying the reader, in the clever full-length of *Mrs. John White*, by the young Parisian-American, JOHN SARGENT, an impressionist of a special order. The manner is sketchy to verge of the "blottesque," but the figure is deftly thrown into the round, upon a background meagrely furnished, by emphasising the high light on a long sweep of white drapery, and the face, in spite of an inkiness in the shadows, is *vif* and agreeably pronounced. The colour is kept to silver greys, with a touch of pale red. The mannerism is clever, and rather taking when sufficiently coherent. That it can be anything *but* coherent, let anyone judge by the portrait from Mr. SARGENT's brush in the Grosvenor Gallery.

#### NOTES FROM PARIS.

IF a logician wished to write a companion to Dr. Whately's "Historic Doubts Respecting Napoleon Buonaparte," he could hardly find a more fitting subject for his essay than the statue of *Liberty*, which was said to have been designed for New York by M. Bartholdi. Descriptions were given of all the details of the work ; its size and weight were compared with other statues, and even the rivets were counted ; but, with the exception of the engravings on advertisements in Europe and America, there seemed to be no evidence of the figure itself. The traveller to New York looked for it in vain from the steamer, and it was no less invisible in Paris. It is not surprising that many believed the statue to be a myth. In spite of logic, Napoleon did live in Paris ; and it is no less true that the statue of *Liberty* now stands upright, free from scaffolding or exterior support, in a founder's yard in the Rue de Chazelles. It may be seen by every one who passes along the Boulevard de Courcelles, towering above some of the houses. The smallness of French kitchens is a surprise to English cooks, and it appears almost incredible how such a work could be produced on premises that are so limited in area. The explanation is, that the statue is made up of about three hundred separate plates of copper, which were beaten to shape on a mould, numbered, and fixed like those in an ordinary iron structure. It

can be readily examined, as a staircase leads from the door in the right foot to the chamber which forms the head, and through the openings in the crown Paris can be surveyed. The ascent suggests a visit to a large gasholder in course of construction, especially as the rivet-holes in the plates through which light enters have been punched in square lines. The figure is stiffened throughout by lattice girders, and elaborate calculations have been made in order that the structure may be adequate to resist American storms. The copper plates are strengthened by iron bars, which are bent into the form of the folds of the drapery, and are united with the girders. That engineering skill was as necessary as the sculptor's art in order to produce the figure is evident when it is said that the total height of this combination of thin copper plates and iron, measured to the top of the flambeau in the right hand, is 46 mètres, or about 150 feet ; the height to the top of the head being 34 mètres, or about 111 feet. The pedestal of masonry on which the figure will stand will be 82 feet high, and before long New York will thus possess a Colossus 232 feet in height, or 30 feet higher than the Monument in London, and double the height of the great statue of *St. Charles*, by Cerani, at Arona. Considered as a work of art, the statue is entitled to great praise, and no better description of it can be given than the words uttered by an enthusiastic rivetter—"C'est magnifique !"

Before these notes reach London Madame Sarah Bernhardt will have attempted the representation of Lady Macbeth. The experiment is watched with no little interest by some among the English in Paris, and by many Frenchmen. The old notion of Shakespeare's lawlessness in the drama is no longer universally accepted, although to a Frenchman, who has been taught to believe in the unities of time and place, there are in the plays many things which are puzzling. Several translations of Shakespeare into French have been published, and the humbler class of students can obtain prose versions of eleven of the principal tragedies and comedies for a few pence in the "Bibliothèque Nationale," a series of reprints which has no counterpart in England. It will be said that Madame Bernhardt has not the physique that is requisite for the character. If tested by the imposing standard which Mrs. Seddons created (and which is so often badly copied), Madame Bernhardt will probably be found wanting. But Thackeray, who knew womankind almost as well as did Honoré Balzac, has said that Shakespeare's Lady Macbeth, which is not necessarily the tragedy-queen of the stage, was a weak woman, otherwise she would not have walked in her sleep, and have revealed her husband's misdeeds. Regarded in this way, there will be no inadequacy in Madame Bernhardt's appearance, and her interpretation of the *rôle* may hereafter satisfy English critics. But there is one point which must excite curiosity beforehand. Someone wrote an article on the deaths of men, women, and children which are described in Dickens's novels. What a volume could be produced if a psychologist would analyse the death-scenes which Madame Bernhardt has gone through with a realism that has been derived from clinical study ! In Shakespeare's tragedy we only hear the wail of the woman when there is an end to the queen's remorse in this world. Will M. Richepin, who has prepared the version for the Porte St.-Martin, adhere to the text, or is a scene which the poet has veiled henceforth to be revealed to men's eyes ? "Nous verrons !" That care will be taken with the tragedy is evident from the somewhat uncommon circumstance that Madame Bernhardt's theatre has been closed for a couple of nights to give opportunity for dress rehearsals.

All the world over the kindly feeling which, in spite of rivalry, artists have towards one another finds expression whenever there is the opportunity. One of these occasions was the auction which was held on Monday, Tuesday, and Wednesday of the paintings and sketches left by Ulysse Butin. They were supplemented by works which, as the placard stated, had been "offerts par les artistes aux deux orphelins d'Ulysse Butin," and the list of donors comprised almost every name of note in French art from Mdlle. Abbema to M. Yon. Any man who could buy the gift would have attained at a stroke a representative collection of modern French art. The little girl, by M. Bouguereau ; the mounted soldier, by M. Detaille ; the trumpeter, by M. de Neuville ; the primitive warrior, by M. Luminais ; the child sweeping, by M. Edouard Frère ; the peasant woman, by M. Julien Dupré ; the fauns, by M. Arcus, M. Dubufe, and M. Maurice Leloir ; the ballet-girl, by M. Comerre ;

and the sketch of a woman, by Madame Lemaire, were gems worthy of any gallery. It is now common to employ a child's tambourine as a material for a *fantaisie*. To be successful requires dexterity in the use of colours nearly dry, and the utmost quickness, otherwise the parchment will become wavy. Trifling as it may seem, tambourine painting is not a bad preparation for fresco work. A delightful example was contributed by M. Firmin Girard. The statuettes in bronze, marble, and porcelain were exquisite, and there were some fine drawings on wood blocks by the late Henry Regnault, who was a collaborateur with Butin. If a painter had not a cabinet picture in his studio he sent some of the sketches in his portfolio: thus, for example, M. Vibert gave the pen-and-ink drawing of the choristers, which a few years ago was reproduced in *The Architect*, and M. Baudry gave one of those studies for his figures in the Opera House which are accepted as canons of form by students. The generosity of French artists, whenever there is an appeal for aid, is always to be relied on, and the public are on those occasions liberal in giving prices. On the first day the sum of 85,658 frs. was realised.

There is no doubt that if Butin had lived a few years longer he must have been a rich man. He had made his mark, or, in other words, the public assigned him a speciality. Butin had only to paint fisher-folks and sea-scapes, and patrons were ready to compete for his canvases. His pictures are apparently mere transcripts from every-day life, but the exhibition of sketches demonstrated how great was the toil which the brave artist underwent in order to produce the simplest scene. Butin lived in the fishing villages, and nearly all his work was painted out of doors. If an action struck him as appropriate he watched it again and again, and faithfully recorded any new trait he could perceive. His finished picture was, so to speak, the characteristic idea which is exhibited under diverse circumstances. What can be simpler than the well-known figure of the fisherman carrying an anchor on his back? But a comparison of his studies will reveal the fact that Butin observed many a man thus burdened before he attained his end. His studies were not in crayons only; often they were elaborate works in oils, and it would seem to have been his practice to carefully arrange all the parts of a picture on canvas, and then keep the work for consideration before he took up that canvas which was to be shown to the public. It would be difficult to discover better examples of the thought which is needed in order to make a picture out of a commonplace incident, or to convert prose into poetry, than the sketches which remained in the studio of Ulysse Butin.

The opportunities for employing artists are so much more numerous in Paris, it is not surprising that, somehow or other, a French artist is rarely in absolute impecuniosity—unless it be through his own fault. If there is no market for his pictures he can make designs, if it were only for industrial purposes, or apply his pencil to some kind of decoration. One of the latest ways of utilising art is the introduction of etched menu cards. In England it is possible to obtain cards in black or in many colours, which some people consider to be very fine; but the best among them are manufactured in America, and are mere specimens of mechanical engraving, and, one might add, of mechanical designing. They are to be had in thousands, and are sold to hotel-keepers as well as to hosts who wish to make a display. A Paris gentleman can without any difficulty obtain an etched card that will be not only worthy of admiration for its beauty, but which has the advantage that the design is not to be seen at any other table but his own. The plate can be his property in the same way as the plate of his visiting card. Many of the etchings are works of art, and the quality is simply a question of price. Etching on copper is not much more difficult than etching on paper. The process is restricted in England to expensive pictorial works, while in France it is used to transform simple things into objects of beauty.

The exhibition of the works by M. Meissonier, which was opened in M. Petit's gallery on Friday, the 23rd inst., contains ninety-one pictures. Some have been lent from English galleries. The Queen has sent *La Rixe*. Sir Richard Wallace's collection, which is one of the richest in works by the artist, is represented by *Les Bourgeois flamands*, *Les Amateurs d'estampes*, *Partie perdue*, *Le Décaméron*, and *Le Guetapens*. There are also a *Portrait de Meissonier* and *Recherches littéraires* from M. Gambart; *Un*

*officier de mousquetaires* and *Le Porte-Drapeau*, from Mr. Duncan; *Le Portrait du Sergent* and *Les Joueurs d'échecs* from Baron Schroeder, and *Regnard dans son cabinet* from Mr. Price. The works which M. Meissonier has lent are *Les ruines des Tuileries*, *Le Chant*, *Le Graveur à l'eau-forte*, *A la fenêtre*, *M. Thiers sur son lit de mort*, *Les Tuileries*, *Intérieur de l'église Saint-Marc*, *Portrait d'homme*, *Intérieur flamand*, *La partie d'échecs*. The money received from the visitors, which is sure to be a large sum, is to be handed over to a charitable society which has charge of a night refuge.

There will be a sale of drawings and paintings by M. Berne-Bellecour at the Hôtel Drouot, on Thursday next. This artist, like M. Detaille and M. de Neuville, devotes himself mainly to military subjects. The catalogue for the auction is small in size, but as it has *photogravures* of some of the pictures, amateurs are willing to pay ten francs for a copy.

The roadway of the Pont des Arts, which connects the Place de l'Institut with the Quai du Louvre, is being renewed. The bridge is used only for foot passengers, and is very often introduced in sketches of Paris life, for one may encounter on it influential politicians who prefer to walk to the Assembly by the quais rather than by the gardens of the Tuileries, renowned members of the Académie, and humble students of science and art hurrying to the Quartier Latin or the Rue Vaugirard. One-half the bridge is closed to traffic. The removal of the roadway shows that the iron ribs which form the arches are of rather slight dimensions, but the bridge sustains an immense traffic throughout the day, and it has been crowded on occasions. There is a strong timber superstructure of longitudinal and transverse bearers, and over all is a coating of asphalt. The bridge was erected in 1803, and until 1848 tolls were levied on the passengers. One of the outer arches was removed in 1852 for the enlargement of the Quai Conti.

It is hardly creditable to English taste to find Mr. J. C. Robinson, F.S.A., bringing his collection of Renaissance medals to Paris in order that he may sell them. There is, of course, but one meaning in the transaction, namely, that there is a more profitable market here, because the people are better able to appreciate that class of sculpture. If the question is asked why the difference should exist, an explanation is easily found. The production of medals is still practised in France; collections of them are found in every museum; there are many dealers, and even the poorest can obtain a copy of a gem from one of the boxes on the quais. What is more important, there are courses of lectures on medals as well as on other subjects, which elsewhere are supposed to be the property of a few connoisseurs.

It would be difficult to find critics whose eyes are more keen than those of French journalists. They are always putting something or other under the microscope, and startling the public with discoveries. It has just been asserted that the popular novel "*Le Maître de Forges*," which has been dramatised and is being played successfully at the Gymnase, with Madame Bernhardt's husband in the principal rôle, is little more than a translation from the Swedish. Another surprise has been found among the pictures purchased by the State at the Salon. It is said that M. Dantan's *Modèle d'atelier* is only a translation to canvas of a photograph. But the picture has none of the stiffness that is almost inevitable when figures are posed before a lens. May we venture to suggest an opportunity to the French critics which they have somehow overlooked? Let them compare an old photograph of the Duchess of Teck bending over one of her children with the pleasing *L'Amour maternel* by M. Saintin, and they will have a subject in which they can revel.

**Bristol.**—The new building for the Capital and Counties Bank in Baldwin Street, Bristol, is now nearly completed. It has been designed and erected under the superintendence of Mr. F. Mew, architect, Doughty Street, Mecklenburgh Square. Mr. Honey has acted as clerk of the works, and the builders are Messrs. W. Cowlin & Son, Brunswick Square, Bristol. The frontage is built of granite up to the first floor. The floors are concrete, and the walls are in Staffordshire brick, with cement. The ceiling is fire-proof, and built by Messrs. Dennett & Ingle, of London.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary meeting of the Institute of Architects was held on Monday evening, Mr. Ewan Christian, president, in the chair.

The SECRETARY announced the death of Mr. Edwin Nash, who had been a Fellow of the Institute of long standing.

Mr. FOWLER said that he had had the pleasure of personally knowing the late Mr. Nash, and that he should not wish the announcement of the death of a member so well known, and a friend so valued, to pass without a word in tribute to his memory. That gentleman too, while health had permitted, had been a constant attendant at their meetings, and taken part in the discussions, to the benefit, he thought, of them all.

The PRESIDENT said he cordially agreed with what Mr. Fowler had said of the late Mr. Nash, and then added some remarks of his own testifying to the professional worth of the deceased gentleman.

Mr. WILLIAM EMERSON then read a paper, of which the following is an abstract:—

**Description of some New Buildings at Allahabad and Bhow-nuggur, India, with Remarks on Domes and the mingling of Styles of Architecture.**

There were various points, Mr. Emerson said, to be considered in arranging buildings suitable to Indian purposes, points which architects were not brought into contact with in England, and which involved such differences in construction as to make it a delightful experience to leave the old highways of English architectural thought and to work for a while in India. These points were chiefly the climate, with its intense heat and its total rainfall, almost incessant, but limited to a few months; next, the habits of the Oriental, which made it hard for him to work save in the accustomed grooves of his ancestors; lastly, the innovation of modern Western thought, and, it might as well be added, of science and culture so opposed to all the antecedents of the conservative Hindoo and to his caste prejudices. In Allahabad the average heat was from 85 degrees to 98 degrees in the shade. At Nassich, in tents under the mango trees, he had experienced 120 degrees of heat. Hence the necessity for elaborate means of ventilation, for verandahs, and for walls shaded by overhanging eaves. This arrangement gave a character to Indian buildings quite unlike that of our western ones, and affording the architect scope for picturesque dealing with light and shade unattainable in England. With regard to the habits of the Oriental workman, it was shown in detail how much the English architect has to put up with in India, how completely he must possess his soul in patience, unless willing to run the risk of death by heat apoplexy. Mr. Emerson had to allow for a considerable percentage of defective workmanship, as was illustrated by his plans for a church and for the Muir College, both at Allahabad, and for the Takhtsingji Hospital at Bhow-nuggur. As to the style of architecture to be adopted by the English in our peninsular dependency, Mr. Emerson accepted, with some modification, the conclusion arrived at in Mr. Chisholm's last year's paper, "that an architect practising in India should unhesitatingly elect to practice in the native styles." The present reader's later idea was that buildings erected under the British Raj for any purpose connected with the natives, whether for government, education, or charity, should show a distinctively British character, at the same time adopting the details and feeling of the native architecture, and suiting it to the requirements of each particular case. In answer to the objection that this would create a hybrid style, it was asked whether the mingling of Mahomedan and Hindoo art had not resulted in some of the most enchanting buildings of the world, as exemplified at Bejapore and in the North-West Provinces. In Europe, also, were there not buildings as noble as any in the world—for instance, St. Sophia's at Constantinople—which were hybrid in style? Other examples were the Palermo Cathedral, the San Miniato at Florence, the interior of St. Mark's at Venice, and the apse of our own Canterbury Cathedral. Indeed, were not the loveliest flowers and plants hybrids? and had not the intermingling of the different human families produced the noblest types of men? This was Mr. Emerson's apology for the architecture of the Muir College and of the Takhtsingji Hospital, which he felt must be described as hybrid. These buildings of his carried out, as he proceeded to show at large, his idea of impressing the stamp of the British Raj on modern English erections. Some sketches of Indian details, which he exhibited, explained whence he got his inspiration. Though for the most part from Mahomedan buildings they were nevertheless of Hindoo origin. That from the fort at Agra was certainly old Hindoo work re-used by the Mahomedans, and so was the column from Bejapore. The decoration from Pashan was also Hindoo. One of the most interesting points to himself in these Indian works of his, Mr. Emerson said, was the chance of introducing domes—a chance rarely falling to the lot of an architect practising in England. In the dome over the hall of the Muir College he had taken the type of the Taj Mahal for outline. He described his own dome, instancing the points of resemblance and difference between the two. He added a comparative account

of the library dome of the college and of the hospital dome. After a comprehensive survey of the principal domes in east and west, Mr. Emerson said it seemed to him that the highest perfection attainable in the construction of a dome would be a combination of the arched pendentive arrangement of Mahmoud's tomb surmounted by a circular dome of the conical section of St. Maria at Florence, or that of the tomb of the Shah Khoda Benda, with a slight additional bulbousness of the haunches and a weighty cornice hung inside about one-third of the height above the springing. Part of this idea was in his mind when he designed the dome over the Sitzungsaal in the competition for the Berlin Houses of Parliament. In this case he proposed supporting the large lantern by flying buttresses over the dome rather than by a double shell. One good point of this construction internally would be that the spandrels would offer such advantages for mosaic or fresco, being at an easy angle of vision—an important thing at a great height. He believed that with Portland cement concrete and a network of galvanised iron or copper embedded in it, to supply the fibre lacking to concrete, the upper part being composed of an aggregate of light specific gravity, with heavy material at the base, we might construct perfectly stable domes of larger size than any ever yet built, of more effective external and internal design, and of comparatively light weight. Internally the dome was by far the grandest and most impressive method of covering a large area. There was a mystery about the gloom of the interior of a vast cupola that well suited the imagination of an Oriental. And in all great architecture there should be a certain mysteriousness. He had read that a science without mystery is unknown, and a religion without mystery was absurd. He felt sure they might add that architecture without an element of mystery is unpoetical and unimpressive. It was this quality in our great Gothic cathedrals, caused by the ranges of columns, arches, and vaults, that was the chief reason of their attractiveness, but they lacked the feeling of immensity and spaciousness given by the dome. Yet a dome should not be too light nor its vastness too easily penetrated. He thought the effect of St. Peter's was marred by this. The interior of St. Paul's was on this score more effective. Some would ask, How about the decoration? Well, the decoration of St. Peter's was too plainly visible, and if St. Paul's should be treated correctly by means of well-designed subjects with strong outlines, devoid of dark shadows, and rendered in the brightest glass mosaic, it would be quite visible enough down below, with enough of the mystery emblematical of all spiritual and heavenly things. But for decoration in such a position the colours must be brilliant, for the joint effect of distance and the atmosphere would be to dull an emerald green down to grey and a bright vermillion to dingy red. Mr. Emerson said he had often wondered why our architects who had had the chance had never erected a dome in connection with a Gothic church in England. It was not needless, as was proved by our enormous congregations, many of whom could neither see nor hear on account of the blocking up of the lungs of the churches with the enormous piers. He wanted to see a magnificent Gothic interior opened up after the manner of the Duomo at Florence, and numbers of other Italian churches. But he could not see why the grandest of all features should be almost exclusively found in Classic and Oriental work. There might be certain difficulties to be overcome, but nothing insurmountable, and with the earlier types of transitional architecture the dome would perfectly harmonise. Might it not happen that in such an endeavour to blend Classic and Gothic we might strike the architecture of thirty years hence, as hinted by Professor Kerr in his interesting paper read a few nights ago? Let it be a Renaissance suited in every way to our modern requirements, not such as Italy saw in the fifteenth or sixteenth century, but a Renaissance of the mingled spirit of Classic and Gothic exemplified in some such works of an earlier century as he had already mentioned. The desiderated Renaissance was one with arms long enough and bold enough to embrace the lintel, the round arch, and the pointed arch, the picturesqueness of the Gothic vault and the dignified nobility of the Classic and Oriental dome, with an elimination of the crudities of Gothic art, and an enrichment with the graces of the Classic style. Before such an architecture a style which worshipped nothing but quaintness, whose ideal of nobility was only the picturesque, and whose detail and sculpture were debased and meaningless, might surely vanish into the haze of oblivion from which it was evolved. But he did not yearn after a Renaissance whose constructive element was iron. That might suffice for bridges of thousands of feet span, for earthquake-proof buildings, for fireproof roofs and floors, for girders, ties, and cement. An architecture to be noble and impressive must not be wanting in mass, and an iron edifice was but a skeleton wanting the clothing of flesh and skin to give it life and beauty. We called that a human skeleton from which soul had fled, and on the same principle an iron architecture would be found to lack the nobility of a living art.

A discussion followed the reading of the paper, in which Mr. Chisholm, Mr. Aitchison, Professor Kerr, Mr. Woodward, Mr. Stannus, and Mr. Tarver took part. Many of the remarks passed accorded very generally with those made on previous occasions when the subject of domical construction has been in question.

The points of interest will be found treated of on another page. The proceedings were terminated with a vote of thanks to Mr. Emerson for his paper.

### CATHEDRAL PLANNING.\*

ENGLISH architects seem to have grasped with a firm hand the artistic qualities of the cruciform plan. Lincoln Cathedral is an example, and perhaps it might be difficult to find one more complete in itself or more typical of our national peculiarities. As a mere ground-plan it is a work of fine art, well-proportioned and interesting, with beautiful forms employed about it. The foot of the cross is sufficiently deep to balance its great length, being formed by the two western towers and transepts. These latter are of little or no use to the nave as transepts; both are closely screened off, and used for the independent purposes of a morning chapel and a consistory court. They have still less to do with the elevation being only of the same height as the side aisles; but they have a distinct architectural value on plan. The nave has seven bays, the two westernmost being narrower than the others, originally without doubt because it was built from the choir to meet the older Norman work of the front. The Norman nave, as seen between the towers, was narrower than the present one. But these two narrower western bays bring the transept vaults, of equivalent width, into harmony and connection with the side aisles, and are beautiful specimens of groining. The dimension of these two nave bays governs the projection of the transepts, which we feel to be the just one, as it has base enough to balance without rivalling the great crossing. If we were dealing with a cross in upright elevation, the base would bring the cross on to the ground-line, which carries the eye away beyond the projection of the arms. The screens which divide the nave from the chapel and consistory court are original work, not later additions. Notice their value to the whole plan. They carry the nave at its normal width past the transept, till it butts against the towers. Though the transepts only effect a junction with the side-aisle vaults, and do not pass the main arcade, the nave would have been shortened and its proportion to the whole lost, besides the creation of a western rival to the great transepts, had these low stone screen walls been omitted from the plan. For the sake, therefore, of its hidden beauty, and also for that of the architect, who brought the older building into union with his with such consummate skill as to make a perfectly-proportioned plan out of two incongruous parts, we trust that these screens may yet long escape the hands of the "unbroken vista" lovers. Before leaving the west end, observe how artistically the octagonal turrets turn the corners of the front. They are poised in an unusual way, having but little projection on the front and considerable at the sides and back. This may be merely because the front pre-existed of a fixed width, which did not agree with the dimension that governs the western transepts. In all probability, one of ourselves—a modern architect—would have made our transepts extend just a trifle more, so that the pinnacles should stand at the exact angle of the building, but then the valuable "claw" they exercise on the plan would have been lost. As they stand they furnish fixed points from which we can comprehend the scheme of the base.

Peterborough has a small plan with a simple outline, as there is distinctly no feature to interrupt the cross. It is in this simple completeness unique, and contrasts remarkably with the plan of Lincoln. Its proportion as a whole is good. If there is a fault, it is that the upper part of the cross is a trifle too long. Half the width of a bay of the Lady Chapel might be spared. In nearly all English plans, whatever may have been the original length determined on, subsequent alterations have pushed the building eastwards, generally with the happiest effects, as this otherwise inordinate extension of the upper part was made proportionate by such successful expedients as choir transepts, or by a diminution of width in the presbytery, or by a more considerable one in the Lady Chapel beyond; also by the accentuation of the main crossing, with the same purpose in view as at Ely and Winchester. The western transepts, which form the *raison d'être* of the Peterborough façade, are like those of Lincoln in one respect, being of little projection in proportion to their depth, their dimensions being the width of the side aisles. They are divided from north to south by the wall which gives recess to the front and produces a marked effect on plan. It reduces the western transepts to a width which makes them a base or plinth to the cross. At Lincoln the base to the cross is formed by the square subdivided masses of the towers; the western transepts counterpoising the greater transepts with the entire length of the church, the screen walls purposely preventing the foot or plinth of the cross from being realised in order to preserve the effect of the nave. The Peterborough nave is long enough, and the transepts consequently can become not merely an external counterpoise to the other masses of the building, and be partly absorbed by the nave, but have a definite relation to the idea of the cross at its foot. The total depth is just as necessary to the

whole, and what is superfluous to the plinth is cut off by the cross wall and becomes the glorious recessing to the arches of the façade. This is the secret of the mystery of the front. Anything but a hollow sham having no relation to the whole, it is, in fact, the result of a masterly and beautiful plan. The towers which bound the front are delicately and subtly stepped forward with almost the effect of a curve, and form the lower feet from which the cross rises firmly and gracefully, the broad splaying of the arches and the recesses behind aiding this impression. The later porch which projects beyond is fortunately cut off on plan by the recesses. Peterborough is the only cathedral plan I know that can be looked at in upright elevation with entirely satisfactory results.

Salisbury, though on a smaller scale, is a plan of similar proportions and scheme to Lincoln, but without the western transepts. It was built a short time after the nave of Lincoln, in 1220. It is a double cross having transepts of the same relative projection, and there is but little difference in the proportionate lengths of the choir and presbytery. The scheme of the cloister and chapter-house is also similar, but they are in a position which the exigencies of the site did not permit at Lincoln on the south side of the nave, the more usual position. To a certain extent perhaps this position may give a finish or balance to the western end of the cathedral on the south side, but something seems needed on the north. The porch would scarcely supply the need or be important enough for the position. The length of the nave without being interrupted needs the balance and base that the western transepts give to Lincoln. A comparison between the two cathedrals in these particulars is the more justifiable, as both the west fronts are designed on the same principle, being façades, distinct architectural compositions complete in themselves, with corresponding turrets at the ends. These turrets are not pitched on the intersection of the front and side on the "correct angle," but are placed as terminations to the front, though they have not enough projection in spite of this on the plan to furnish us with the points that the Lincoln turrets give, and we consequently miss its completeness and beauty in this respect. A visitor to Salisbury feels there is a lack of interest at the further end of the nave, especially after turning from the choir; it seems too long a walk. It cannot be that the architect was unwise enough to design that this impression should be produced to increase the effect of his west front *tour de force* awaiting one beyond the welcome door. It must be remembered in criticising Salisbury that it is practically the work of a single mind and generation, being one complete erection, at all events as far as the plan goes. This is scarcely the case with any other of our Mediæval cathedrals.

Winchester has a small Lady Chapel terminating the east end, like Salisbury, but has only one grand transept, and no projections at the west end. It does not seem to feel the lack appreciably, as one fears, that the interesting proportions of the chancel should be damaged. At Salisbury the double transepts brought the projection along the body of the plan in a swelling gradation. The east end of Winchester is sufficiently removed from the great transepts to be independent of them, and complete in itself, and in its relation to the entire length of the plan.

Durham has a burly massiveness in plan, true to the character of other aspects of the building. The so-called chapel of the nine altars (I cannot but think it should be seven) crowns the cruciform, as one did once at Lincoln and Fountains, in a complete and final manner, but subservient to the central transepts. The nave is finished by the slight projection of the western towers, that seems the exact amount required to balance the whole without disturbing the mass of the east end.

Ely as a whole is simpler in outline than any we have been considering, though we bear in mind the extraordinary feats of constructive skill and beautiful design wrapped up in it. The nave, choir, and presbytery are unusually long and wide, but well balanced by the great transepts, comparatively short in projection. The design of the west end is unique—narrow but massive transepts, with a small apsidal chapel, nestling against the south side of the nave. I am inclined to think that the design contemplated a corresponding chapel on the northern side. This little chapel gives the transept depth enough to balance the plan, and being low, plays no prominent part externally. The chapel has here exactly the same object to attain as the screen walls at Lincoln. Though the two plans are different in almost every particular of design, we see that the architect had the same result to attain, and succeeded by a different method in each case. Five turrets nearly circular on plan complete in a magnificent manner the design of the transepts, and make Ely an interesting example of western transept planning. The Galilee porch interferes slightly with the happy result, owing to the great thickness of its walls necessitated for abutments to the arches that carry the central western tower. This was not the case with the Galilee at Durham, as the walls were not too thick to look delicate on plan.

Leaving strictly English examples, Westminster, in spite of its general tendency to depart from national types, is English in having a plan that is complete and beautiful as a whole, the base of the western towers having enough projection to make a satisfactory termination to the nave. Sir Christopher Wren's plan of St. Paul's has western transepts which are not quite happy in proportion. They seem either too large or too small, too large and

\* From a paper read by Mr. A. B. Pite at the eleventh ordinary meeting of the Architectural Association.

deep for the length of the nave, and not far enough for the great transepts to aid their proportion. The nave could not well have been lengthened, as its huge arches would lose scale by further repetition. The western transepts seem too small, when we realise that if they had been equal in size to the great arms of the cross the nave would have been perfectly balanced, though this would have been a departure from the proper cruciform plan. We find this carried out in the plan of Minster Cathedral, a building though small in comparison with St. Paul's, more huge in scale. The nave consists of two spans. The eastern and western transepts are the same in size, have but little projection, and are of the same width as the nave. Their size, however, does not interfere with the latter, which passes through the eastern crossing into the chevet, and through the western for an equal distance to a porch. In the examples as yet referred to the western transepts have been connected with the façade, but at Minster they have no relation to such, the front being a gable between two simple square towers.

The cruciform plan produced long churches, as the crossing arms divided the length and gave interest to points in what, without them, would have been a mere corridor. Our architects who were content to trust themselves to the cruciform plan for a supply of sufficient interest and beauty, naturally found at the crossing the centre and most important part of the design. This is why they concentrated their powers on the design of those lantern towers which are the glory of our cities and ours alone. Their thoroughness in adhering to a definite scheme of plan has been amply rewarded. The continental architects, who either did not perceive the vantage point they possessed at the crossing, or were careless of it, produced no cathedrals which can rival the English in beauty and dignity of grouping. The fact that the square east end was the rule of our English practice has not a little to do with the emphasis given to the crossing; being conscious that the building could be terminated at any point to meet whatever proportion already existed, the transepts were lengthened and widened to group externally with the lofty tower, and give space and effect to the interior. The transepts, as a consequence, are much more important and valuable here than abroad, their repetition beyond the choir being most fruitful of artistic results. Both at Lincoln and Salisbury the choir transepts are of beautiful proportions, narrower, and of less projection than the great transepts, and seem based on a cross of which the choir forms the stem and the sacrum the head, their point of crossing being the top of the main cross, of which the other transepts are the arms, forming a cross within a cross, and yet maintaining their share in the whole plan. They effect a junction with the main vault, unlike their western brethren, the continuity of which is, however, undisturbed. Having been brought by their means now to the east end, we cannot but feel that there is no other possibly successful termination for the cathedral but a square wall, the rectangle having been the foundation of all the beauties we have been enjoying. And we have reason to be proud of the self-restraint our architects displayed in their way, and wonder what posterity will find of that quality in our own work.

I do not propose to refer to the transepts of foreign cathedrals apart from their apses and chevets, to which they are entirely subsidiary, though this brings us in contact with Westminster, where the transepts and chevet seem to maintain an interesting and ceaseless struggle for supremacy on plan. This is not visible externally, as, most wisely, the lantern-tower has not been built. The combination of a lantern-tower, of sufficient height and size to be proportionate to the whole building, and a chevet, has yet to be accomplished. St. Ouen, at Rouen, is nearest the goal, but the charming lantern is too small for the nave. Noyon is a rare example of a cathedral which, though of second or third-class dimension, is completely planned; the apsidal transepts are distinctly typical of French design. Soissons Cathedral has one such beautiful transept with an aisle, but owing to the lines of the site the northern transept has to be kept square. Noyon was originally united to the see of Tournay, the cathedral of which has apsidal transepts of much greater size with aisles, but they are too far from the chevet, and interfere with the nave. At Noyon, apart from the feeling of harmony that the three semicircles give to the plan, there is a great lack of correspondence in proportions. The transepts want enlargement in the direction of the nave, as they are overpowered by the chevet. St. Reim, at Rheims, is perhaps the nearest to successful treatment. Here the transepts are square ended, but have the usual apsidal projections on their sides nearest to the chevet. They are well known for the interesting puzzle solved in vaulting four bays on the west wall into three on the opposite. The church has a grand nave of thirteen bays, and this gives much dignity to the plan. The weak point is that the transepts want a little more width. The increased projection of the centre chapel of the chevet gives a beautiful apex to the plan, such a one as the pointed arch had brought the architect to look for. The smaller church of Notre Dame, Chalons-sur-Marne, is a happy proportion as a whole, the chevet not being too large for the nave, but the transepts are small. In fact, we find that the chevet was developed at the expense of the transepts and entire plan. The French architects did not display that balance of mind in planning which they proved themselves to possess when constructing their vaults. At Chartres we find the transepts of a good width, but shortened

considerably as the chevet has grown in size, and possesses two encircling aisles besides its chapels. The nave suffers accordingly, as it has only one pair of aisles, and is of comparatively small area. Notre Dame, Paris, has a beautifully complete plan, but the transepts have practically no actual projection beyond the line of the apse, which here, as at Chartres, has two encircling aisles and chapels besides, bounded by the semicircle of the apse. The nave has double side aisles and chapels between the buttresses beyond them, which makes it sufficiently wide to balance the great mass beyond, and produce a well-proportioned whole, but at the expense of the real transepts. The plans of Rheims and Amiens are other illustrations of the sacrifice of transept projection in consequence of the use of the chevet, which always asserted its claims to attention, to the detriment of other portions of the cathedral, and which, though based on the cruciform plan, hid and overrode its lines most unmercifully. The examples that we have of the use of Germany made of the chevet do not furnish us with any notable exceptions to the results that it produced in France. The chevet of Augsburg Cathedral is interesting because, being confined by the sweeping curve of the street at the east end, the architect did not permit himself to be deprived of the proportion to the whole that he wished to obtain by means of his apse; so he contrived to dispense with the real encircling aisle, and carried the walk into the main apse, across behind the reredos. The result externally is picturesque. Perhaps the most typical eastern termination is the use of three apses corresponding with the nave and side aisles, early and semicircular, at Brunswick, and semi-octagonal—like our bow windows—in the later work of Ratisbon. This latter cathedral is throughout of the most just and harmonious proportions, and the plan, though small in size and simple, is complete. The transepts have no external projection. The chapels on either side are nestled behind the screen walls, and have the sacristy and treasury beyond them. The cruciform which lies buried in the triforium is not apparent on the plan, the architect's sense of fitness cautioning him against its use with the apse.

## THE BLENHEIM COLLECTION.

AN application was made to the Chancery division on Saturday for the sanction of a sale of twenty-five pictures, comprising a part of the Blenheim collection, the whole of which consists of some 500 pictures. The petition has been ordered to stand over for a week. The following are the twenty-five pictures which have been selected for sale, and which are stated to be worth 400,000*l.* :—

1, Raphael—"Madonna Ansdei;" 2, Sebastiano del Piombo—"La Fornarina;" 3, Rubens—"The Three Graces;" 4, Rubens—His own portrait, with that of Helena Foument and infant child; 5, Rubens—Helena Foument attended by her son; 6, Rubens—"Venus, Cupid, and Adonis;" 7, Rubens—"Andromeda;" 8, Van Dyck—Charles I. on horseback; 9, Rubens—"Lot attended by his Daughters;" 10, Rubens—Bacchanalian subject; 11, Rubens—"Adoration of the Magi;" 12, Rubens—"Departure of Lot and Family;" 13, Rubens—"The Holy Family assembled in an apartment;" 14, Rubens—"The Return of the Holy Family from Egypt;" 15, Rubens—"Filial Piety" (*Caritas Romana*); 16, Rubens—Anne of Austria; 17, J. B. Weenix—"A Seaport in Spain;" 18, Rubens—"The Distribution of the Rosary;" 19, Rubens—"Suffer the Little Children;" 20, Van Dyck—Catherine, Duchess of Buckingham and family; 21, Van Dyck—Geneviève d'Wifi; 22, Mytens—Duke of Hamilton; 23, Van Dyck—Marie de Medicis; 24, Carlo Dolce—"Mater Do'orosa;" 25, Carlo Maratti—"Triumph of Christ."

## LICHFIELD CATHEDRAL.

THE preparations for the dedication of the west front of Lichfield Cathedral and the opening of the new organ on the 29th inst. are being rapidly pushed forward. Figures of the four minor prophets, Nahum, Amos, Obadiah, and Habakkuk, have just been placed in position, and the statue of King Solomon is now completed and ready for placing in position. The statue represents the king in full regal costume with the sceptre in the right hand and a model of the temple in the other. These figures are by Mr. Robert Bridgeman, sculptor, who has supplied about sixty of those already fixed. Space is allowed for upwards of one hundred figures. Statues of Richard I. and Edward III. are awaiting removal, and others will be ready before the dedication-day.

The Select Committee on the Parks Railway Bill have decided that the preamble of the Bill has not been proved. The Committee, however, will make a special report, and if they can approve of the principle of the Bill the measure may be reintroduced next session with an improved scheme of junctions, which is understood to be the point upon which mainly the present proposals have failed.

## NOTES AND COMMENTS.

THE Burlington Fine Arts Club have decided on a new departure, so to speak, by inaugurating an exhibition of drawings of architectural subjects by deceased British artists. In doing this the Burlington Fine Arts Club shows a desire no longer to ignore architecture, the highest of all the arts, a place among the arts in an art club. The club authorities by their own account decided that "an attempt should be made specially to deal with architecture as a branch of fine art." This decision would be easier to arrive at than to carry into practice, because the range of architecture as art is practically unlimited in its multitudinous phases, and recognises not the bounds of time or country, epoch or nationality. The sub-committee were, therefore, very prudently left to feel their way by easy steps under the words of the resolution, "drawings of architectural subjects by deceased British artists," and were allowed to interpret these words as they considered best.

SOME artistic aspects of the art are now presented to the public in the charming water-colour drawings of TURNER, PROUT, DAVID COX, and DAVID ROBERTS, along with drawings of the two COCKERELLS, BARRY, WYATT, EASTLAKE, SYDNEY SMIRKE, NASH, FERRY, the two PUGINS, PAPWORTH, STREET, and W. BURGESS. Some architectural designs have been hung in a room apart from the exhibition proper, and include designs by INIGO JONES—his design for the Palace of Whitehall for one; also designs by DECIMUS BURTON, including the original designs for the still incomplete arches at Hyde Park Corner, and again GRIMM's drawings of Cowdray House, near Midhurst, in Sussex. There are, too, drawings by the Brothers ADAM, &c., &c.

IT was hoped that it would have been possible to bring together a curious series of original drawings, illustrative of Sir CHRISTOPHER WREN's successive designs for St. Paul's Cathedral; the Dean and Canons having placed their collection at the disposal of the committee. But here, as at All Souls' College, Oxford, the Wren drawings are mounted in books, so that to exhibit them was not practicable. This interesting passage in the history of architecture has, however, some illustration in the copy by Mr. PENROSE of one of the All Souls' designs, and in two highly finished interiors of St. Paul's; also in SANGALLO's design for St. Peter's, and TURNER's superb *View of Ely Cathedral*, a design and building each of which is said to have afforded suggestions to WREN.

THERE is much genuine interest in the Exhibition, and sterling merit in most of the work that is displayed. The most distinct and valuable curiosity of the collection is certainly the display of drawings by INIGO JONES. They are about twenty in number. Two of them belong to the QUEEN, the rest to the Duke of DEVONSHIRE. The QUEEN's drawings are the original perspective views of the Westminster and river fronts of Sir INIGO's great palace. They are extremely elaborate, and will prove very interesting to the student of architecture.

THE Exhibition of Works in Wood at Carpenters' Hall, London Wall, is to be open to the public on and after Monday next. The two City Companies who have got it up (the Carpenters and the Joiners) are to be congratulated upon the result of their efforts, for both in extent, in the variety of the objects sent in, and in the excellence of the most conspicuous among them, it attains a very high level. The woods used in joinery and carpentry are illustrated by two series of excellent specimens. Models of roofs, floors, centres, staircases, doors, windows, and chimney-pieces are exhibited in considerable number, and in many instances the designs are ingenious and the workmanship good. A few models and other representations in wood of buildings are included, but none of them are very successful. A large display of inlaid work, such as table-tops, chairs, and cabinets, has been contributed, and much of it is very satisfactory. But the great feature of the exhibition unquestionably consists of the specimens of wood-carving. The prizes offered in this department have been keenly competed for, and the work to which they have been awarded is such as every visitor will examine with pleasure, both for its own sake and as evidence of the skill and taste of the carvers of the present day. The committee

have also been fortunate in securing the loan of much carving—ancient and modern—not in competition. This forms a most interesting part of the exhibition. Foremost in our estimation is a pilaster, decorated with masses of rich fruit and flowers, from the hand of GRINLING GIBBONS. This fine piece is fixed so near the eye that it can be easily examined, and the master's method of working can be studied. It is a rare example of breadth of treatment combined with the most highly-finished detail, exquisite modelling, and rich varieties in light and shade. A splendid mirror, and an almost equally rich mantelpiece, and a considerable number of smaller articles, speak to the skill of Mr. ROGERS, who has also lent some remarkable specimens of German Mediæval carving that are full of interest. A bird—the masterpiece of WALLIS—lent by Sir H. FARQUHAR, and several excellent specimens of ancient work—Italian and German—from the collection of Sir JULIAN GOLDSMID, should on no account be overlooked. The collection of drawings and prints is considerable, and includes some of great interest, and valuable as showing the goodwill with which the exhibition has been regarded in various quarters. Altogether the collection will be found well worth a visit.

A MEETING of the Edinburgh Architectural Association is to be held on Thursday evening, the 29th inst., on which occasion the closing lecture of the present session will be given by the President, Mr. DAVID MAC-GIBBON, who has chosen the interesting subject of Scotch castles and houses of the fifteenth, sixteenth, and seventeenth centuries for his lecture. The annual excursion has been fixed to take place on June 14, and will be made to Kelso and Jedburgh. This (Saturday) morning is devoted to a visit to the Forth Bridge Works, arrangements having been made for the purpose with the contractors, Messrs. TANCRED, ARROL & Co., and which will enable the members of the Association to inspect the structure during working hours. The afternoon arrangements comprise a visit to Queensferry Church, Barnbougle Castle, Dalmeny House and Church.

A NEW feature in art is the bird's-eye view of London as seen from a balloon, which is to be published in the *Graphic* next week, and which is sure to attract attention. Mr. W. L. WYLLIE, who is the artist, was accompanied on his balloon voyage by the well-known aeronaut, Mr. SIMMONS. The production of even a bird's-eye view of London is, owing to its size, almost an impossibility. Mr. WYLLIE, in passing through the air, was able to see much; and by making careful sketches in detail from various points of vantage in the metropolis he has been enabled to render them into an harmonious whole, and the general effect has evidently been successfully caught by the artist. The extent of London is so vast, and the atmospheric conditions generally so bad, that it is not easy to get a bird's-eye view of London even from a balloon.

ATTENTION has been called to the state of Stirling Castle, with a view to restoring the interesting buildings which are now put to use as barracks and stores. The castle is rich in ancient historical buildings. It has a palace, begun by JAMES V. and finished by MARY, the remains of an older palace dating prior to the reign of JAMES II., a Parliament House built by JAMES III., and a Chapel-Royal founded by JAMES VI. A correspondent writing on the subject says that the palace still retains externally much of its pristine grandeur. Its spacious apartments, however, have been cleared of all their ornamentation. Fortunately a large number of the figures, carved in oak, which used to adorn the apartment known as the King's room, fell into the hands of the Stirling authorities, and are carefully preserved. Others found their way into the possession of various persons of taste throughout the country. Perhaps in the event of a restoration these figures could be collected, and once again allowed to adorn their rightful place. The portion that remains of the earlier palace has been considerably knocked about. This part is of great antiquity, and has been the scene of many historical events. One of the rooms was the scene of JAMES II.'s assassination of the Earl of DOUGLAS. The Parliament House has suffered more damage than any other of the structures by the introduction of partitions and the insertion of two storeys between the floor and roof. The original large and beautifully-arched windows were built up and substituted by others more suited to the altered state.

ALMSHOUSES, LEISTON, SUFFOLK.

THESE almshouses are in course of erection for the labourers on Mr. OGILVIE's estate at Leiston, in Suffolk. Each dwelling contains a living-room, kitchen, and scullery, with two bedrooms over, and is designed as cheaply as is consistent with actual comfort. The materials are red bricks made on the estate, with timber construction above, brick nogged and rough cast. PERCY G. STONE.

DESIGN FOR AN ACADEMY OF ARTS.

THIS design—which was one of the few submitted for the medal of the Royal Academy—is by Mr. WILLIAM G. B. LEWIS, Architect.

SEYMOUR LODGE, DUNDEE.

THIS lodge was built for the proprietor, Mr. HENRY MCGRADY, and has been finished within and without in the most careful manner. The principal rooms are finished in oak and other ornamental woods, and all the mantelpieces, sideboard and other recesses, have been handsomely decorated to special designs. Over the sideboard is a window which has been filled with stained glass, representing domestic virtues—the architects' design—and executed in the highest style of the art, by Messrs. BALLANTYNE & SON, of Edinburgh. Cathedral glass has been used in all the lobby and staircase windows, giving a very rich interior effect. Local stone has been used, with Fifeshire freestone corners.

All the works have been carried out by local tradesmen, with the exception of the stained glass and iron railings. The architects are Messrs. C. & L. OWER, of Dundee.

UNITED PRESBYTERIAN CHURCH, NEWPORT-ON-TAY.

THIS church has been lately completed to accommodate 400 persons; and under the church is a hall to seat about 200, with heating chamber, vestry, lavatories, &c. White Fife freestone has been used throughout. Provision has been made for the insertion of a gallery to seat 100, the staircase to which is provided in the tower. Tinted cathedral glass has been used throughout, except in the west circular window, which is stained, which window was a presentation one, as were also the cushions with which the whole church has been furnished. The effect inside is warm and comfortable, and the acoustics are all that could be desired.

The architects are Messrs. C. & L. OWER, of Dundee, whose design was selected in a limited competition, in which Mr. LEIPER, of Glasgow, acted as professional referee.

HOUSE, FONNEREAU ROAD, IPSWICH.

THE alterations and additions just completed to this house, which was illustrated last week, have made it a very convenient town residence. The work has been carefully executed by Mr. E. CATCHPOLE, builder, Ipswich, under the direction of Mr. WM. EADE, architect, Post Office Chambers, Ipswich.

## THE ARCHITECTURAL ASSOCIATION.

THE twelfth ordinary meeting of the Association was held on Friday evening, the 16th inst., Mr. Cole A. Adams, president, in the chair.

Mr. COX announced various donations which had been made to the library, and a vote of thanks was duly awarded to the donors. Several works had also been purchased for the library.

The following gentlemen were elected members:—Messrs. E. W. Lewcock, W. Stirling, W. Alford, P. A. C. Wilkinson, E. J. Cooper, C. J. H. Cooper, C. Earp, and A. B. Walters.

## The Travelling Studentship.

Mr. W. H. ATKIN BERRY, hon. secretary, read the following award which had been made by the judges, Mr. T. E. Collcutt, Mr. C. Henman, jun., and Mr. T. Batterbury, in the competition for the Association Travelling Studentship, and addressed to the hon. secretaries:—"We have the pleasure to inform you that we have awarded the travelling studentship to Mr. S. J. Oakshott, and the prize of 5*l.* to Mr. G. G. Woodward. We specially commend the drawings submitted by Messrs. W. H. Bidlake, G. G. Wallace, and E. H. Selby." There were nine competitors.

## Nominations.

The list of nominations of officers to be elected at the next ordinary meeting, to serve for the session 1884-85, was read. Mr. Cole A. Adams, the retiring president, was nominated for re-election. Mr. C. R. Pink and Mr. H. W. Pratt were nominated as vice-presidents.

Mr. J. A. GOTCH then read a paper on "John Thorpe and the English Renaissance," which appears in another page.

Mr. WYATT PAPWORTH said that twenty years back the subject had interested him very much, and that he had then hoped to do what Mr. Gotch had now done. Mr. Gotch, by his examination of the plans, had to a great extent elucidated the subject of the book. He had thought that John Thorpe was an amateur, and not an architect, judging from the drawings in the work and nothing more; but he thought that Mr. Gotch had shown that Thorpe was an architect. The names of other architects of the same period were not recorded, nor did they seem to have been noticed in the county histories. Stow mentioned the house of Lord Derby as in course of erection, but he did not give the name of the architect. Looking at what might be called the sanitary arrangements, it was curious to find that at Wollaton there was no privy on the ground floor, that at Burleigh there were two on the ground floor, and at Kirby there were nine on the upper floor. In the house built at Wanstead by Wellesley the centre was arranged for his own occupation, and the two wings formed separate and complete dwellings in themselves. Shute died a year after publishing his book, and, except that he called himself a painter and sculptor, nothing was known about him, though there was an inscription on his tombstone setting forth that he designed a large number of buildings, &c. Mr. Papworth said none of the plans shown that night apparently were planned in the familiar form of the letter E. The plans in each case were either on the principle of the French château or the central court.

Mr. R. PHENÉ SPIERS said that when Mr. Gotch pointed out that John Thorpe's drawings were represented partly in perspective and partly in elevation, his thoughts reverted to the time when he joined the Architectural Association in 1856, when the practice in design was partly in elevation and partly in perspective. It would be interesting to know how it happened that Robert Smithson was said to have been the architect of Wollaton Hall. There was a theory as to the authorship of the design of Longleat, that plans for a mansion prepared by John of Padua, but never carried out, had been put into the hands of John Thorpe by the inheritor of the property, an ancestor of the present Marquis of Bath, and that John Thorpe had erected Longleat from them. Smithson was connected with the building of Wollaton Hall, but whether as clerk of works, assistant, or really the designer of that great edifice, was a question. Wherever the architecture was obtained the plans were English. An important feature was noticeable in the prominence given to bow windows or blocks. The three projecting blocks at Cowdray with their windows were quite sufficient to give an architectural character to the house without any other decoration. In France, Italy, &c., we noticed, with the absence of these blocks, a natural craving for some ornament by the use of Orders one above the other, columns, &c. John Thorpe did not seem to notice that the columns were intended to be actual portions of the structure. Throughout Italy, especially in the better structures, it was found that the termination of the wall always had a column. Thorpe applied them to his buildings simply as decoration. He used them to divide the wall into a series of panels or long horizontal lines, &c. The Town Hall at Brescia was perhaps the only building in Italy which was an exception to the general purity of style. The pilasters were slightly within the building, and not at the end of the block.

Mr. J. D. SEDDING remarked that Montacute Hall, said to be the work of John Thorpe, showed the E plan. He said that he could not agree with Mr. Gotch that everything joyful and light-some came in with the Renaissance. His view of it was exactly the opposite. The Renaissance movement was the death of craftsmen, bringing in as it did clever men with their sketch-books, whom the native craftsmen had to follow. He himself was a student of Gothic, and he regarded it as anything but characteristic of a dark age. When one thought of all the imagery the Mediæval buildings were filled with and of the Mediæval workman, with his fancy so unfettered, one was struck with the little of fancy that was to be found in the sculpture of the Renaissance period. As to columns being used regardless of construction, might it not be that John of Padua followed the Venetians, who applied columns in the same way as marble by way of veneering and not of structure?

Mr. SPIERS said that he spoke of Thorpe rather than John of Padua.

Mr. KERSHAW, M.A., Mr. CLARKSON, and Mr. STOKES also made some remarks.

A vote of thanks was then passed to Mr. Gotch for his paper, and that gentleman having replied, the proceedings terminated.

The Building Trades Exhibition at Bingley Hall, Birmingham, closed on Saturday last.

## ARCHITECTURE AND ITS ARCHIVES.

By S. W. KERSHAW, F.S.A.

ARCHITECTURE, like other sciences, has its annalistic history, not only in the stones which fashioned so skilfully into the wondrous buildings of past ages, those cathedrals, churches, and abbeys which are the rich inheritance of our land, but in the more silent, though hardly less expressive agencies which survive in records, fabric rolls, manuscript illuminations, seals, sketches, and in the monkish chronicles of old.

Many are the sources whereby architecture has left its impress on our thoughts, ideas, and associations. As naturally we look first to the author or designer of buildings, so the lives of those master workmen, the "superintendents of buildings," as they were formerly called, first attract our notice. Of those lives, still so dimly known even to us now, and whose work has left its mark in the arcading, the rich vaulting, the cloisters, or the stately towers of our churches, much can be studied and enjoyed. Although records have been silent about many an architect of our great Mediæval shrines, yet history has enabled us to point with much certainty to the more noted of those whose names are famous and authentic. At that time, several of the prominent architects were "clerics" as distinguished from the laity, and the prelate builder, if I may so call him, takes a foremost place in our early annals. At Canterbury were the ever-remembered works of Anselm, Lanfranc, Gundulph, William of Sens, "the English William," Cardinal Morton, Cichele, Prior Goldstone and others; at York we read of Archbishop Walter de Gray and John le Romeyn; at Winchester, William of Wykeham, Bishops Waynflete and Fox; at Exeter, Bishop Grandisson (whose design of the west front, rich in sculptured figures, is widely known); at Wells, Bishops Jocelyn and Beckington; at Ely, Bishops Hugh, Alcock, West, and Alan of Walsingham; at Lincoln, the famous "St. Hugh of Lincoln" and Bishop Grostête; at Hereford, Bishop Cantilupe (whose shrine has become a note-word of beauty); at Worcester, St. Wulfstan; and at Durham, the famous Ralph Flambard. This roll of great names is but a tithe of those whose designs are recorded only in stone, and of whom no written record exists; but the matchless value of their work is their best monument, instructing even to-day by its beauty, consistency, and power.

The ways and means of raising money for church building in early ages was pious and liberal; for miles around, contributions poured in for the work, taxes were levied on certain articles, pilgrimages were made, and indulgences were a frequent source of revenue for the increase and repair of all structures. With St. Paul's of old, indulgences were much in fashion; for the repair of Paul's Cross and other portions of the cathedral we constantly find allusions in archives and MSS.

The fabric rolls and registers of the bishop's See, in each respective diocese, offer abundant and curious information as to the payment of wages, the maintenance and condition of buildings, and other particulars. Thus, in the register book of St. Osmund, Bishop of Sarum, is a plan of Salisbury Cathedral, *circa* 1260-1300. The Register has recently been edited for the Rolls Publication Series by the Rev. W. H. Rich Jones. This, an isolated example of what the student of Mediæval history may find in searching for architectural lore, is but one of a thousand. Another occurs in the Lambeth MS., No. 1,106, and has in the margin a sketch of the west end of old St. Paul's, thus showing how valuable is the connection of architecture with the documents of its time, and that help to the judicious "restorer" may frequently come in welcome guise from almost unexpected sources. The late Professor Willis in his learned remarks on the "Conventual Buildings of Christ Church, Canterbury," found able illustrations thereto in a drawing preserved in the Psalter of Eadwin at Trinity College, Cambridge, a drawing made about 1165, wherein is figured the whole of that Norman priory, so well known by some of its exquisite fragments now remaining in the cathedral precincts.

To multiply instances by the aid of ancient documents would be endless, and but one more occurs to my mind, that of Waltham Abbey, whose restoration by the late W. Burges was much assisted by MS. lore. In the British Museum are two twelfth-century MSS., entitled, "De Inventione Sanctæ Crucis," and in these was the legend of Waltham Abbey and its foundation.

Another form of documentary aid is to be found in the monastic chroniclers, who generally gave full scope to the facts and occurrences which related to their own particular minster, priory, or abbey. The names of several are familiar to most of us, as the Chronicle of Florence of Worcester, Simeon of Durham, Abbot Benedict of Peterborough, and Roger de Hoveden, who gave York Minster his special regard.

In some particular instances we find curious and special knowledge—thus, in the Monk Gervase's account of the burning of Canterbury Cathedral; Ingulphus, the historian of Croyland; Gilbert the Norman, of the foundation of Merton Priory; William of Malmesbury's account of the church of Glastonbury; the annals of Waverley Abbey, and similar chronicled accounts. Minute statements are recorded in these histories, which treat of the materials used in construction—stone, lead, roofing, bronze, and woodwork.

There are also preserved in some of the chapter libraries of our cathedrals the "Red book," or accounts of payments and wages. Several of these were destroyed in the Civil War period, especially at Lichfield. That period also recalls the existence of documents known as Commonwealth or Parliamentary surveys, which frequently describe the condition and site of buildings. Plans and sketches sometimes accompany these surveys, as in the case of St. Paul's, where a plan of the chapter-house and cloisters, made in 1657, is now preserved in the Public Record Office.

Cathedral statutes, some of which have lately been printed, as Chichester, St. Paul's, Salisbury, and Lichfield, often mention church restoration and repair; and would that every capitular body in our land caused such documents to be published, under proper and learned guidance, to the assistance of archæological and artistic research!

Of the various branches of architecture, the Monastic draws much of its inspiration from MS. sources; indeed it may be said that the abbey and its literature grew together, and that the annals of the one were the foundation-stones of the other. Notably, the Cistercian receives much prominence among the religious orders, and the Cottonian MSS., British Museum, give lists of the various abbeys throughout the world. Cistercian architecture, and its varying modification of plan and arrangement, had such an able and learned exponent in the late Edmund Sharpe, that it is needless to do more than mention his name to the student who wishes to master this fascinating form of art.

Here it may be mentioned that to the abbey charters, documents, or records, was often attached the seal of the prior or of the house. These were often treated architecturally, and form, when chronologically studied, a series of instructive stages of Mediæval art.

In the same cloistered seclusion of the chronicler was the illuminator of MSS., and here the illustration of architecture is very abundant. The artist monk, one of superior attainments, was deputed to undertake the drawing and painting of those finer studies which enrich the missal, breviary, or book of "Hours."

In all MSS., from the tenth to the fifteenth centuries, we find indications of architectural skill, from the vigorous but characteristic interlaced outline ornament of the Celtic school (also seen in the crosses and sculptured stones of Great Britain), to the flagreed shrine or canopied figure that bespeaks the exuberance of decorative design.

Churches and their details, exterior and interior, are to be found pictured in every illuminated MS., and where the student will examine the drawings with a certain reservation, much may be learnt. The general treatment of buildings in MSS. is pictorial rather than technical; the date of the MS. does not always fix that of the building, hence anachronisms and technical errors arise. When the architectural drawing is *contemporary* with the MS. itself, it is a most valuable aid, and cannot be too highly prized.

The rare, illuminated MSS. in our National Library supply endless examples; the accessories and ornamental parts of architecture are fully displayed in these books. Church furniture, lecterns, bench ends, altars, pulpits, screens, shrines, niches, panel work and other beautiful adjuncts of the art are found in unwearying succession.

The development of these and other decorative features in MSS. has formed the material for standard works and essays on the subject by the late Owen Jones, Sir Digby Wyatt, Henry Shaw, all of whose treatises are of acknowledged repute.

Another class of what may be included among archives are the rare drawings and sketches of those architects of the sixteenth and later centuries, the pioneers, if one may so speak, of the Renaissance period. In our own country can be named the drawings and designs of John Thorpe (of fame in the Elizabethan houses), of John Shute, John of Padua, Holbein, Sir Thomas Tresham, Inigo Jones, Sir C. Wren, and others. Abroad, those of Bernini, Bramante, Vitruvius, De l'Orme, Palladio, Du Cerceau vie in interest with native talent.

The exhibition about to open at the Burlington Arts Club of drawings of deceased architects possesses great merit, as displaying, chronologically, the works of well-known men who, much before and after the Gothic revival, have influenced the character of our public and private buildings.\* Water-colour, pencil, and pen-and-ink are represented in this collection, and during the conference week some drawings of the late talented artists, Street, Burges, and Viollet-le-Duc, will be on view at Conduit Street.

The private note or sketch-books of architects are gems in their way, and unprepossessing though the outside may be of yonder thin volume, it is of priceless worth, as being the note-book of the great artist-architect, Leonardo da Vinci, to be seen in the Library of the Brera, Milan.

Another example is before me in the albums of Willars de Honecourt, Durer, Stuart, and others. These and like are the very treasures of architectural art, for in them the characteristic genius of the designer is often seen.

\* The chief examples are by Prout, Carter, Girtin, Sandby, R.A., Edridge, Pugin, Cockerell, Ferrey, Street, Burges, Wyatt, Stuart, Nash, Cattermole, &c., &c.

By the preservation of drawings in our public museums, they have in truth become artistic archives, and in this way Sir John Soane's Museum, the college libraries and galleries of Oxford and Cambridge, have become unique and famous for these special examples.

The union of letters with architecture has had a certain influence in moulding the taste of the period. It cannot be denied that the works of Sir Walter Scott have had their bias in developing the love of the old, which that writer so fully put forth, and which, with other circumstances, helped to stimulate the "Gothic revival" of this nineteenth century. Spenser and Shakespeare have both described architecture, and the fascinating imagery thrown over the works of the former may have had much to do with the buildings that arose in the Elizabethan and earlier eras. The revival of learning has always brought its influence on the arts. The decorations at Fontainebleau owe their existence to the Italian taste, which, introduced by Francis I., found its way into many other structures, and notably in the châteaux of the Loire.

We in England experienced the new manner, and in many a portal or enriched pilaster, even though it be in a far-off mansion, are the sculptured carvings and the classic foliage that tell of foreign growth.

Though literature undergoes, as it must, constant changes, the archives which have given the clue to many a hidden difficulty will remain, and thus may "Art and Letters" be described as hand-in-hand.

### JOHN THORPE.\*

THE beginning of the sixteenth century witnessed a series of important events, which, though occurring in widely different spheres of action, may all be traced to one cause, a reawakening of mankind from the intellectual torpor in which it had been cast by the religious system of the Church of Rome. The backbone of that system was authority. To the officers of that Church were confided the only keys that unlocked the mysteries of the universe. They alone were competent to explain the secrets of nature; they alone were able to introduce sinful man into the august presence of the supernatural Powers. In their cloisters were immured the only students. Almost all knowledge, almost all chances of obtaining knowledge, lay with them. Outside their walls was an intellectual desert. Laymen were content with struggling for existence, either as potentates bent on buffeting each other, or as knightly followers of such potentates, with whom they were content to stand or fall, or else as serfs, with whom the struggle for life lost much of its charm. Laymen had neither time nor inclination to exercise their intellects: with them brute force was not only their umpire in all disputes, but actually their boon companion.

Perhaps the most notable exception to this state of things was to be found in Italy, at the very doors of the Pope's own citadel. Italy was not given over to strife, as the rest of Europe seems to have been. Here men still retained some love of culture, and were content to match their wits against other men's swords. When, therefore, from innumerable causes all working in the same direction, men began to awake from the lethargy of the dark ages, Italy was a fruitful soil, in which the new seed rapidly brought forth an abundant harvest.

This reawakening of mankind, this new birth, has very happily been termed the Renaissance; but it would be a mistake to suppose that the term is applicable only to architecture, or even the arts. The Renaissance in art is only one phase of the great upheaval which affected the whole world—religious, literary, artistic, and political. In religion we call the same movement the Reformation. In English politics it found expression after a time in the great rebellion. In literature one result was Rabelais, with his brutal scorn of bigotry and priestly pretensions; another was our own Shakespeare, the very embodiment of all that is purely and delightfully human.

England's part in this movement was directed to rendering assistance rather than taking the initiative. Both our Reformation and our Renaissance were imported, as printing was. With the Reformation, however, we need not trouble ourselves further. The Renaissance is more than enough to occupy our attention.

It has been observed how excellent a soil Italy offered for the fructification of the new seed. The harvest that ensued can only be fully appreciated by those who have visited the country. Out of her fulness she could well spare something to her neighbours, and we are not surprised to find Italian artists visiting and permanently residing in foreign lands. France, being nearer the source, was influenced first. England, however, was not long in catching the Italian fever. It affected everything—modes of thought, modes of speech, writing, eating, dress, manners, building, gardening. Italy was the bourne whither all young men went on their travels, and they returned saturated with Italian ideas, which, when they came to express them in an English atmosphere, underwent a

curious change. Roger Ascham, in his "Scholemaster," first published in 1570, laments this "Italianating" of English youth.

If Scylla drown him not [he says of the young man who has gone to Italy], Carybdis may fortune swallow him. Some Circes shall make him, of a plain English man, a right Italian. And at length to hell, or to some hellish place, is he likelier to go: from whence is hard returning, although one Ulysses, and that by Pallas aid, and good council of Tiresias once escaped that horrible Den of deadly darkness.

And further on he says:—

If some yet do not well understand what is an Englishman Italianated, I will plainly tell him. He, that by living, and traveling in Italy, bringeth home into England out of Italy, the Religion, the learning, the policy, the experience, the manners of Italy.

And yet, in spite of Ascham's denunciations, he, in common with all of his age, was deeply infected with a spirit which, if not Italian, came to us primarily from Italy—I mean the classical spirit which pervades the whole literature of that time. In another book of his, "Toxophilus," he says plainly that it would have been easier for him to have written it in Latin or Greek, and takes some credit to himself for having written, as he says, "this English matter in the English tongue, for English people." His great desire, moreover, was to see English poetry written in hexameters instead of in rhymed lines. This experiment has been tried more than once, but success is impossible. The hexameter is not suited to the English tongue, and the fact of Ascham advocating it so strongly shows how thoroughly he was carried away by the tide of classical learning which overflowed all Europe.

I dwell at some length on the literature of that time, because it seems to me to be very comparable to the contemporary architecture. There is, however, this great difference—that, although both of them abounded with classic forms, literature gradually freed itself from them, and became purely English, while architecture succumbed, and became less and less English with every succeeding decade. Perhaps the most characteristic book of that time is the "Euphues" of Lyly, and a very dull book it seems to be. However, it abounds with classical allusions. Everything is measured with a classical rule. You are pelted with the ancients, their customs, their superstitions, their excellencies from one end of the book to the other. You cannot read a page without coming across them, their gods, their philosophers, or their poets. And the same sort of thing is found in the architecture of the time—Latin inscriptions, Latin epitaphs, statues of the twelve worthies, busts of Roman poets, Greek philosophers, heathen gods, nymphs, and satyrs. And yet, with all this, the books are English, and so are the buildings. Wollaton Hall is no more like the Château de Chambord than Shakespeare's Falstaff is like Rabelais's Panurge.

It took about two generations to invest English architecture thoroughly with the classic spirit. But by the time that wealthy Englishmen had made up their minds that they liked the Italian details, John Thorpe appeared upon the scene. He came at a very fortunate juncture for an architect. The times were settled. The old disputes which had convulsed England from the Tweed to the Exe were disposed of. The country gentlemen, whose houses had been their castles, found the old fortress arrangements ill-suited to the growing elegance and luxury of the age. They wanted new houses. The revenues of the dissolved monasteries furnished them with ample means. House-building became the rage. The fever seized on the whole nation from the Lord Treasurer to "Mr. Johnson ye druggist," both of whom were clients of John Thorpe.

Some people are inclined to doubt whether Thorpe really was an architect, and to hold that he was merely an amateur who made sketches of existing work or of the large houses that were then being built; and it is not easy, from his book alone, to prove that they are wrong, for among the drawings is a plan of Henry the Seventh's Chapel at Westminster, which, from anything it says, and did we not know otherwise, we might almost conclude to be as much his design as the others. However, I hope to satisfy you from more than one source that Thorpe was actually an architect.

Before proceeding to argue about the book, however, it may be as well to describe it.

It is a volume of folio size, some 17 inches by 12 inches, consisting of sheets of thickish, rough drawing paper, with a particular watermark. The pages are used both back and front, as though it had been bound before being used; but yet this clearly cannot have been the case, since some of the drawings go right down into the fold of the book, and have evidently been bound up after completion. In one case, however, a plan which covers two pages is stopped short of the crease or fold by a straight line, and continued on the opposite page from a similar line, thus avoiding the burying of any part in the fold. The drawings, generally speaking, are in ink over pencil-lines, and in many cases the pencil-lines have not been rubbed out. Some few are in pencil only, but these generally are slight and rough. There are many more plans than elevations, and there is only one section. There are a few pages of full-size mouldings, one of the Five Orders, carefully drawn with proportional lines; one or two of sketches for ornament, and one with elaborate instructions how to put a building into perspective, instructions which seem generally to have been neglected by

\* A paper read by Mr. J. A. Gotch at the meeting of the Architectural Association on May 16.

Thorpe, for his perspectives are far from correct. The drawings seem to have been ruled in with a common pen, and probably with a rolling ruler. Some of the plans are very neatly done, most of them are tolerable, some are bad. The elevations, or "uprights," as he calls them, are generally indifferent: they combine the geometrical and the perspective treatment, not altogether with success. If these are the best drawings turned out from the leading office of the time, we may congratulate ourselves upon the advance made in architectural draughtsmanship since the Renaissance.

There are 282 pages in the book, some score of which perhaps are blank. More often than not there is one drawing to a page—perhaps the ground plan on one page, and the upper plan on its opposite. But many of the designs have nothing but a ground plan; so whatever the book is, whether a note-book or a collection of original designs, it is not a complete account of the buildings shown.

There are about one hundred and forty different buildings illustrated, of which some fifty occupy two or more pages; only fifty-five of the one hundred and forty are either identified or have a title put on them by Thorpe. There remain therefore some eighty-five of which we know absolutely nothing except that they appear in this book. If we could identify these eighty-five we might perhaps get to know something more about the architect himself. Of this large number a few are clearly only freaks of design, and were never intended to be executed. The bulk, however, appear to be *bonâ fide* designs, intended to be carried out. I have roughly classified them thus:—

Fifteen are sketches not likely to throw any light on the subject.

Twenty are unfinished drawings, and may either be designs begun but abandoned, or designs in the midst of being worked out. Some may be identifiable, perhaps, but many of them are hopeless.

There remain forty-seven, of which nine are of half-timber; all the rest except three (viz. thirty-five) are finished designs of large houses, some of them of very great extent; and I have no doubt that did we possess plans of the principal Elizabethan houses still existing, we could track many of them home to John Thorpe's book. Doubtless not a few of the houses there shown have been destroyed, but some of them certainly ought to be identified, and if anyone possessed any plans likely to be of use, I should be very glad if they would allow me to compare them with Thorpe's, or else do so themselves, and acquaint me with the result.

Having learnt something of the book, the question arises, What do we know about the man? And the answer is, Almost nothing. Who was John Thorpe? Where was he born? Where did he die? How long did he live? To these questions we can give no answer.

From three sources only do we know anything about him: from his book; from a plan made by him and preserved in the Record Office among the State Papers; and from a payment to him recorded in the "Issues of the Exchequer."

The plan is labelled "Eltham, 1590," and is a ground-plan of the royal palace there. It has no special title on it to indicate for what purpose it was made; but, judging from its being among the State records, and from the description of some of the rooms—"decayed lodgings" and "the store-house for the works"—it seems to be a plan of the premises made for the purpose of enlarging or repairing them. In the middle of the plan is written, in the handwriting rendered familiar by frequent examinations of his book, "exc. p. Jo. Thorpe"—which fixes its author beyond a doubt.

The other reference to Thorpe occurs, as stated above, in the "Issues of the Exchequer" in the reign of James I., and it is as follows:—

John Thorpe } 4th of June 1606.—More to him for his charges in taking the survey of the house and lands by plots at Holdenby, with the several rates and values of both particularly, with his own pains, and three others a long time employed in drawing down and writing fair the plots of that and of Ampthill howse, and the Earl of Salisbury's, by commandment of the Lord Treasurer of England, dated the last of May 1606. 70*l.* 8*s.* 8*d.*

A plan of Ampthill occurs in Thorpe's book, but none of Holdenby or the Earl of Salisbury's, so far as the plans are identified. We may, however, safely conclude that the above payment was made to the John Thorpe whom we already know, and that he was, in the words of Robert Smythson's epitaph, "Architector and Surveyor."

Examining the various plans in the book by the light thus obtained, it is not difficult to believe that the bulk of them are designs in course of being worked out. Some of them are still half in pencil; not infrequently the upper plan does not correspond exactly with the ground plan, but includes fresh features, often adopted in the actual building, as at Kirby. There certainly are often puzzling notes, as for instance, "kitchen, cellar under"; or "hall, great chamber over"; or "gallery above, all this length"; as though referring to something actually built. But in one case such a note (referring to the floor over) is on the ground plan, when the upper plan is by its side, and these notes are just as likely to be memoranda made in designing, as they are to be items of information about completed work.

Some of the plans actually state that Thorpe was engaged upon the buildings. For instance: "Sir Walter Coap at Kensington, pfected p. me J. T." "Queene Mother's howse, fabor St Jarmin alla Paree, altrd p. Jo. Thorpe," or, "Ampthill enlarged p. Jo. Thorpe." Again, on one elevation beneath three types of windows is written "which of these three is best." All of which tends to show that Thorpe was actually a practising architect, and that here we have his work in the process of design.

Take Wollaton, again. Thorpe gives a plan and half a perspective or elevation, and neither of these agree with the building as executed, nor could the discrepancies either have arisen since drawing alterations, or be the result of careless measuring and drawing, for there is a basement in execution which Thorpe does not show, and the ornamental features are not carried out quite as he has drawn them. Among other things the pedestals of the pilasters have each of them a gondola or mooring ring worked in stone, a useless feature, imported bodily and barefaced from Italy. Curiously enough, on his drawing, Thorpe has two treatments of these pedestals, as though for choice—one is a raised panel, the other a gondola ring. Only on one supposition can these things be satisfactorily accounted for, and that is that in this book we have his preliminary sketch.

Some of the notes on the drawings are rather curious, and would lead to sad confusion in the present day if put on a working-drawing and sent to the builder, for instance:—"Hall too long by 5 fo." "This front is drawn 10 fo. to narrow, not long ynough." "This cort should be 88 fo. square" (when it scales 70 feet), or finally, "This parlor should have been wyder if the paper had suffered it." So that the only solution that really meets the case is the one just mentioned, that in this book we see Thorpe's brain at work.

That these are the working-drawings from which the houses were actually built I do not believe. Several of the plans I have compared with the actual buildings; in all cases there are discrepancies more or less considerable between them. The main idea in each case has been carried out. Even the main walls are built as drawn, but the internal arrangements frequently differ very much, and in essential features; that is to say, the differences cannot have arisen entirely from subsequent alterations. In proof of this I would cite Burleigh House (fol. 57, 58), Kirby Hall (fol. 137, 138, 139, 140), Slaugham Place (fol. 239, 240), and Lyveden New Building (fol. 215, 216). Then, as already observed, there are many more ground plans than upper plans; there are only some thirty elevations out of about 200 drawings, and only one section in the whole book.

Another very important feature is this—that some of the drawings are copied from a French book on architecture, by Jacques Androuet du Cerceau, published in 1576. The two books (Androuet's and Thorpe's) being in different museums, it is impossible to collate them; but, speaking from memory fresh from the subject, three of Androuet du Cerceau's drawings will be found copied in Thorpe's book—viz., the theatre at St. Germain's, plan and elevation; the plan of the Château de Madrid, Paris; and the plan of the Château Anssi le Franc. They have quite a distinct appearance, and differ from the bulk of Thorpe's drawings; but a close examination of the two books will go far to show that the Englishman was largely infected with the Frenchman's love of quaint planning. In fact, the quaintest of Thorpe's plans have a French origin.

Having thus come to a conclusion respecting the character of the book itself, let us look a little further at its author, and then at the general character of his work.

In the first place, then, his book covers a large number of years. The earliest date written in it is 1570, in a note on the ground-plan of Kirby, "whereof I layd ye first stone A<sup>o</sup>. 1570." This agrees with the date of 1572 actually on the parapet. The latest date is 1621, on the plan of the Queen Mother's howse, "altrd p. me Jo. Thorpe." The period thus covered is fifty-one years, and is practically coincident with the beginning and end of what we call the Elizabethan and Jacobean styles. There are a few intermediate dates, as 1596, 1600—in which year he was in Paris, as he has plans of "Mounseer Jammet his howse in Paris" and of "St. Jermin's House, V leagues from Paris." The only other date is 1606, on a house for Sir William Haseridge. But apart from these dates, which are actually written with his own hand, we can date many of his buildings from other sources, and thereby obtain a tolerably close sequence, commencing with 1560 and ending in 1621.

Several of the drawings, however, especially the earlier ones, are evidently taken from buildings already erected, and the first identified house which we can suppose to have been designed by him seems to be Copt Hall, in Essex, the date of which is given as 1564 to 1567.

The whole book is devoted to houses; the only exception is Henry the Seventh's chapel, and the commencement of what looks like the east end of a church or cathedral. Among the designs are included many of the very largest and stateliest structures of that age, as the following list will show:—Theobalds, for Lord Burleigh; Buckhurst House, Sussex, for the Earl of Dorset; Loseley, near Guildford, Sir George More's; Knowle, near Sevenoaks, for Lord Buckhurst; Kirby Hall, Northamptonshire, for Sir

Humfrey Stafford; Burleigh juxta Stamford, for Lord Burleigh; Wollaton, near Nottingham, for Sir Francis Willoughby; Longford Castle, Wiltshire, for Sir Thomas Gorges; Lyveden New Building, for Sir Thomas Tresham; Audley End, Essex, for the Earl of Suffolk; Holland House (enlargement), for Sir Walter Coop; Aston Hall, Birmingham, for Sir Thomas Holt; Somer Hill, near Tunbridge Wells, for Lord Clanrickard; Slaugham Place, Sussex, for Sir Walter Covert; Danvers House, Chelsea, for Sir John Danvers. If we could identify others of the plans we should be able to extend this list.

We have made Thorpe out, therefore, to be an active architect, with a magnificent connection, embracing many of the leading men of the time. "An interesting question would be—How did he get it? But to this we can give no answer but surmise. He may have been sent to Italy by one of his patrons, as John Shute was by the Earl of Northumberland, there to pick up a knowledge of Italian work, and to acquire, as he says, "the tricks and devises as well of sculpture and painting as also of architecture." At any rate, Thorpe seems to have succeeded better as an architect than did Shute, who is only known by his book on the "Chief Groundes of Architecture."

Or he may have studied in France. There is no doubt that he closely studied Androuet du Cerceau. Not only did he copy some of his plans, but he took them all very much to heart, and not improbably borrowed the idea of four corner pavilions from him. There are several of Androuet's plans with these features; but the earliest of Thorpe's in which they are really developed is Wollaton Hall (1580-1588), Androuet's book having been published in 1576. It would seem also that Thorpe was much struck with some of the fantastic designs in the French book. There is one of a hexagonal building, having a projecting arm on each alternate face; another forming a cross, with a large pavilion at the end of each arm; another hexagonal on plan; and another circular. In Thorpe's book we get a few very similar schemes, but only two are known to have been carried out—viz., Longford Castle and Lyveden New Building—and of these the former is said to have been taken from a Swedish castle.

But though Thorpe was evidently much affected by Androuet du Cerceau, he did not blindly copy him either in his plans or his elevations. The English plans differ in many respects from the French; and though the general idea may in some cases have been borrowed, the working out is always on English lines.

There are, roughly speaking, six types of plan to be found in the book:—1. One or more courtyards, as at Burleigh. 2. A range of buildings with a wing projecting at each end at right angles. 3. A long range with few or no projections. 4. A central block with a pavilion at each corner (the French type). 5. A small compact plan. 6. Quaint designs, made to look well on paper rather than to be useful.

In almost every case, the principal feature is the hall, and in almost every case the entrance is at the end of one of the long sides of the hall, and is divided from it by a screen, the plan universally adopted in that age. There are a few exceptions to this rule, in which the hall is entered otherwise than through the screen, but they are not many. The vestibule formed by this screen gives access on the other side to the buttery and servants' apartments. There is, however, very little scientific planning, and economy is not studied in the least. The only points attended to are these:—One side of the house is occupied by the family, the other by the servants, the common meeting ground being the hall. Generally, near to the latter is the kitchen, and adjoining the kitchen we always find the dry and wet larder, the pastry, and the surveying place or serving place. Upstairs is the gallery, almost invariably made as long as the building will possibly allow. When this is said, everything that can be has been said for the care bestowed on the planning of most of the houses. The staircases are always fine features, and are frequently lavishly supplied. But having once arranged the great eating chamber and its dependencies, and the gallery, Thorpe gave himself little trouble about the rest of his rooms; the parlours and bedrooms came—like the colour of the hair of Benedict's ideal sweetheart—as it pleased God. They were all thoroughfare rooms, and many of them opened into the courtyard. They seem to have been allotted in a haphazard fashion, according to the space at command, and the space at command was frequently regulated by some fantastic notion about the plan.

The consequence of this is that as men's notions of comfort advanced, they either had to put up with much inconvenience, or else had to add corridors, or else simply pulled their Elizabethan houses down and built anew. Apethorpe Hall, which is built round two quadrangles, is, according to the testimony of the inmates, a most inconvenient house, though charmingly picturesque. Burleigh has had a corridor put round the court; Wollaton, being more compact, is much more comfortable, but it requires a very large staff of servants.

In fact, Elizabethan houses were meant for a large staff of servants; they were built for display. In those days of royal progresses enormous crowds of gentlemen and their retainers had to be housed at once. This entailed a large hall for dining, extensive arrangements for cooking, a long gallery for receptions, and a multitude of bedrooms, or "lodgings," as they are called.

Bacon, in his Essays, published in 1598, *i.e.*, about the middle of Thorpe's career, gives us his ideas on the building of large houses. He requires a side of the palace devoted to the banquet or feasts and triumphs, and the other to the household or for dwelling. These are to be "uniform without, though severally partitioned within." Then there is to be a great and stately central tower, with "goodly leads upon the top, railed with statues interposed." The stairs are to "be upon a fair and open newel, and finely railed in with images of wood cast into a brass colour, and a very fair landing-place at the top." "Embowed windows" are strongly recommended, especially in the country; "but let them be but few, four in the court, on the sides only." The court itself is not to be paved, "for that striketh up a great heat in summer, and much cold in winter; but only some side alleys with a cross, and the quarters to graze, being kept shorn, but not too near shorn." In each corner of the court is to be a staircase cast into a turret. Beyond this court is to be another, cloistered all round, and containing private bedrooms and galleries—"whereof you must foresee that one of them be for an infirmary, if the prince or any special person should be sick, with chambers, bed-chamber, antecamera, and recamera joining to it." There are to be three other courts in the front of the house, the first green, the second likewise green with an embellished wall, the third cloistered on the inside with pillars. "As for the offices, let them stand at distance, with some low galleries to pass from them to the palace itself." A great deal is also said about minor matters, about cupolas, and fountains, "and all other elegance that may be thought on," but the gist of Bacon's instructions is contained in the foregoing extracts. How far, it may be asked, do Thorpe's plans embody these ideas, expressed by a contemporary pen? His larger houses carry them out more or less completely, though none of them exactly answer to Bacon's description. Audley End comes perhaps as near as any: we have there the two main courts, one in the midst of the house itself, with a staircase in each corner, the other cloistered and with lodgings round it. The offices, too, are apart, but connected with the main building by a low gallery; and, as for the cupolas and other "elegancies," Evelyn, who saw it in its prime (1654), declares it "shows without like a diadem, by the decoration of the cupolas and other ornaments on the pavilions." But though no one plan contains all that Bacon would desire, they all fulfil more or less his requirements: the staircases on fair and open newels, the leads railed with statues at intervals, the fair grass courts, the cloistered walks, and the embowed windows.

The "partitioning within" of the various wings is also in accordance with Bacon's ideas. On one of Thorpe's plans is a suite of rooms called a "nobleman's lodging." It comprises "his antecamera," "servant's lodging," and a room for "wood, cole, and privy." Every house, large or small, to which there is any writing shows a kitchen, dry and wet larder, and buttery. Most of them have bakehouse and pastry, surveying place, and pantry. A few have a bolting-house, a scullery, a pantler's lodging, a butler's lodging, a small room labelled "pewter," a "boyling house," and a "spicery." One has a day-room for servants, another a "hall for hynds" another a "wayters' chamber." These are the chief servants' apartments. For the family we have the hall, summer and winter parlours, and the gallery, sometimes replaced by a "great chamber." We find also a "dyning parlour," with drawing chamber; breakfast-room, "studdy," library, and chapel; in one case a room for a "chaplen," with "his study" next it; also a steward's lodging, and, adjoining, "his clerk." There is, beside these, a title which I venture to say is never put on a modern plan, however suitable it might be. When Thorpe, in the exigencies of his quaint planning, found he had a space for which he could find no use, he boldly labelled it "waste," and left it.

This list of apartments, though not exhaustive enough for the present day, nevertheless shows a great advance in domestic comfort from Mediæval times. There was, however, as yet no scientific planning, and only a rudimentary knowledge of aspect, as the following extract from John Shute will show:—

Your principall chambers of rest and libraries and such other like must receyve their lightes from the East, for that the sonne by natural heat at his rising draweth to him all corrupte humours and evil vapours of the earth, and quickneth the spirittes of man and beast, and if ye will cast therein baynes or hot-houses, with winter chambers and parlors they shal receive light from the west. For that side is defendid from the south windes which are grevous and contagious. . . . Your study places were you would write draw or devise, or the places wher your sellers should be cast, ought to receive their light from the Northe, by cause in that parte are the lights which are stedfast.

The selection of the north for the apartments named is judicious enough; but the dislike shown to the south is not justified, and the peculiar properties attributed to that quarter and the east are of a piece with the medical knowledge of the times, which was not a little mixed with astrological fancies.

But quitting the subject of plans, let us consider for a moment the architectural treatment of the buildings of that age. Thorpe's designs, so far as they survive, do not exhibit any striking peculiarities which mark them off from all others. He worked chiefly in stone, at any rate so far as the moulded features are concerned. If he had a special mark by which his work may be distinguished,

I should be inclined to say it is in the frequent introduction of heraldic shields; but possibly a further comparison of his work with his contemporaries' might modify this view. His details are no better and no worse than others of the same age. It would be rash to say that he continually improved as he grew older, for Kirby, Audley End, and Slaugham, exhibit no marked differences in refinement. By far the purest work of his, or any buildings of the time with which I am acquainted, is to be found at Lyveden in the exterior cornices. It is an interesting question, which may some day perhaps be answered, as to where the Italian details actually came from, whether from sketch books, or published sources, or full size templates sent over. There are very few of the latter, to judge by the curious distortions which many of the various features underwent. Yet surely these distortions lend a piquancy and individuality which are wholly lacking in the tame correctness of a later age? It is not difficult to trace home to Italy itself the cloistered walks, the entablature, and the entrances; something very like them may be seen in almost any Italian town. But the chimneys, the gables, the windows (especially the bays) are surely of native growth? This, at least, all must admit—that there is something essentially English about our Renaissance, especially about that period in which Thorpe worked. Kirby and Burleigh may not have the purity of detail which marks the Banqueting Hall in Whitehall, but they smack much more of the soil.

Time will not permit us to enter the buildings and examine the interior features, and I should be departing from my text were I to ask you to do so, for Thorpe has no interior details at all, except the full size of a handrail; but before I close I must just draw your attention more particularly to one or two of the houses to be found in his book. And first to Audley End. This is an excellent example of the magnificent scale on which the nobility used to erect their mansions in those days of building. The house as it stands now is very large, but it only covers about a quarter (or even less) of the original area. The kitchen was 52 feet by 37 feet, and the parlour 57 feet by 27 feet. There seem to have been no remarkable features about the exterior save the parapet, which, according to Evelyn, consisted of stone letters, forming an inscription such as exists at Castle Ashby and Temple Newsham. This enormous pile was erected by an Earl of Suffolk who was grandson to Sir Thomas Audley, Lord Chief Justice (I believe) to Henry VIII., and who seems to have amassed a large fortune out of the lands of the dissolved monasteries. It was indeed the old monks' revenues which went to build many of the stately homes of England. Thorpe's connection seems to have been largely among office bearers. Lord Burleigh, Sir John Danvers, Sir Thomas Lake, Sir Percival Hart, and Sir Thomas Heneage all largely depended on the Court for their subsistence. Others of his clients were quite independent of office—for instance, Sir Francis Willoughby, the builder of Wollaton, which, as a composition, may be considered perhaps as Thorpe's masterpiece. The pavilions at the corners, gradually increasing in richness as they ascend, the long parapet connecting them, and the grand mass of the central hall go to form a group which it is difficult to rival. The details are very characteristic: the cornices are somewhat coarse, the pilasters are duly proportioned, and have their bases ornamented with the gondola ring; while in the various niches are busts of Roman emperors, of Vergilius, Aristoteles, Plato, Diana, Mercury, and the other ancients to whom contemporary writers were always referring their readers. Over the entrance is a curious Latin inscription, which I have never yet seen copied correctly. This is the more remarkable, since any mistake destroys its individuality, for it is in reality written in two hexameter lines:—

En has Francisci Willyghbi Militis ædes  
Rara arte extructas Willyghbæisq. relictas.

To which is added the date of beginning and ending:—

Incohatae 1580 et finitæ 1588.

Of Burleigh it is needless now to speak, as also of Kirby, rushing to a melancholy decay—a decay as complete as that which has overtaken Slaugham Place. But one client of Thorpe's, in whom all the world takes interest, and for whom he designed a tiny house to be built in St. James's, was Sir Walter Rawley. There is also a house labelled "Leather End of Holborn," which would locate Thorpe's offices in or near London, possibly in the City. In his plan of Henry VII.'s Chapel we probably see the source whence he adopted some of his peculiar bay windows, and very possibly the fan tracery of that structure supplied the idea for some of the plaster ceilings of the Renaissance.

Among the names occurring as owners of some of the houses are the following, whom I have hitherto been unable to identify, but perhaps this paper may be the means of eliciting information:—Sir Wm. Ruffden, Mr. Johnson, the druggist; Sir Thos. Dorrell, of Lincolnshire; Sir John Bagnall, Sir George S<sup>r</sup> Poole, Mr. Keyes, Mr. Denman, Sir Wm. Haseridge, Mr. Panton, Sir Hen. Nevile, Mr. Taylor of Potter's Bar; Mr. Wm. Powell, and Mr. Ate.

It is time, however, to draw to an end; though not because the subject is exhausted, for I fear I have done little more than touch

its skirts. John Thorpe's book is a large meal to digest; how much more, therefore, the English Renaissance? For my part, I do not care to extol the merits of one style more than another; nor do I see why, because we prefer one particular period, we need therefore go about to deny any excellence to every other. The Renaissance undoubtedly has suffered unmerited obloquy from the early school of Gothic revivalists; but if we reflect a little we cannot fail to see that as the outcome of an intensely interesting age, it demands both attention and respect.

Listening across the centuries to the clamour of the Dark Ages, what do we hear? The din of strife and the ring of hard blows on iron armour. Sometimes above the roar swells the solemn voice of the priest, and once or twice through the lulls we catch the bitter cry of the down-trodden serf. Amid the dust of battle and the flashing of fierce weapons no softening influence, no art is visible, save architecture; and we stand almost bewildered that people so rough and uncultured could have left behind them such faultless art—the one link which binds our sympathies with theirs. But with the Renaissance all was changed. Art triumphed over brute force. The clouds of war began to lift, and with song and laugh mankind emerged from the darkness and took the first step on the path which has never ceased to lead onward to the freedom and comfort which we now possess. We may not neglect an epoch such as that. We cannot live unmoved by the joy which lit the world when Spenser sang and Shakespeare played, when Burleigh counselled and Drake fought, when

The grave Lord Keeper led the brawls,

and when John Thorpe went from place to place, and, amid broad pastures and rustling trees, built into his stately walls not a little of the brightness, the splendour, and the airy fancies of that brilliant age.

## BOWLING CEMETERY COMPETITION.

IN December last the Bradford Town Council decided to offer prizes for competitive designs for the laying-out of the proposed cemetery for the Bowling district. The area intended for the proposed cemetery will be fifty-six acres, and although the Corporation required the competitive designs to include the whole of this area, they do not intend to carry out the whole design at once, but to leave about one-half of the site unappropriated. Competitors were required to set apart portions of the ground for the Church of England, Dissenters, and Roman Catholics. Chapels for each of the above sections to be provided at an estimated cost of 1,500*l.* each for the Church and Dissenters, and of 800*l.* for the Roman Catholics. Registrar's, gardener's, and sexton's lodges, were also to be included in the design, at a cost for the whole not exceeding 1,800*l.*

At a quarterly meeting of the Town Council just held, the following award was approved of. The design marked "Salus Populi" for laying-out the grounds, "Home" for the erection of the buildings; "Fiat Justitia" as second in order of merit, and "Red Cross" as third in order of merit. On opening the sealed envelopes the authors of these designs were found to be: Of "Salus Populi," Messrs. George Heaton, Wigan, and Mr. W. H. Ralph, Chester; "Home," Mr. W. J. Morley, architect, Bradford; "Fiat Justitia," Messrs. George Hepworth & Samuel Wilkinson, architects and surveyors, Brighouse; and "Red Cross," Messrs. Hepworth & Wilkinson, and Messrs. Smith & Woodhouse, Manchester. There were twenty-four competitors in all.

## REVIEWS.

**GASWORKS: THEIR ARRANGEMENT, CONSTRUCTION, PLANT, AND MACHINERY.** By FREDERICK COLYER, M.Inst.C.E., M.Inst.M.E. (E. & F. N. Spon.)

Within the last few weeks a portrait of William Murdoch has been presented to the Birmingham Picture Gallery. It is not improbable that to a great many visitors the name will not excite the least interest. Yet Murdoch was one of those men who were more liberal benefactors to the town than the donors of large sums of money. When in the year 1798 he lighted the workshops of Bolton & Watt he may be said to have created the industries connected with gas illumination, and they have done much to establish Birmingham in its present position and bring it wealth. Other men followed Murdoch in utilising coal gas; but he deserves the credit which Watt has in connection with the steam-engine—that of being the first to bring within the range of business a phenomenon which hitherto had been interesting only to laboratory students. What Murdoch's invention means to the world can with difficulty be inferred from the statistics which show the enormous sums that are invested in gasworks.

The process by which coal is distilled, purified, and distributed is simple enough, and any mystery that might be apparent about the works will be dispelled by a perusal of the treatise which has lately appeared from the pen of Mr. Colyer, an engineer who is

known as the author of some useful books on breweries, pumping machinery, lifts, &c. In his latest book, as in the others, Mr. Colyer gives the reader the benefit of his own experience, and illustrates his descriptions by illustrations which are copied from working drawings of executed works.

Gasworks do not meet with much favour from the owners and occupiers of property in towns, and the general wish is to have them relegated to some out-of-the-way site. Nor is this surprising, for the gasholders are generally as hideous as railway stations, and, besides, there is the element of risk. But a good deal depends on the position of the site, and it has been found that low-lying works can be flooded, and a town, in consequence, left in darkness. A site near a river, along which barges can pass, has the advantage of economy in the haulage of materials. The builder's work in connection with the works requires to be carefully constructed, and of somewhat greater strength than is expected in ordinary buildings. Mr. Colyer recommends that the least thickness in the walls of a retort-house should be 18 inches, and the concrete under the retort-benches 4 feet. A roof that has been found to answer well for houses of moderate size is one "of wood and close boarded, or of trusses made on iron with wood purlins, and close boarded." Wrought-iron girders are used for the coking stage, and the floor is made of 4-inch York stones or chequered plates. The coal stores should adjoin the retort-houses, and their size will be regulated by the character of the works. It is suggested that "the depth of the storage of the coals should not exceed 10 feet, and even less than this is advisable when floor space can be had." With a greater depth the lower strata of a heap is likely to be crushed, and thus deteriorated. Advice of this kind is valuable to a tyro, and there is plenty of hints of this kind scattered through the pages. The machinery that is used is fully described, as well as the tanks, purifying apparatus, purifiers, travellers, &c. Ample instructions are given in respect to gas-holders of various capacities, but it is said that "professional assistance should always be sought in all cases relating to gas-holder and tank construction, to avoid the serious errors many have fallen into, and consequent heavy money losses." The gas-holder and tank at Lower Sydenham cost 17,607*l.*, or 10*l.* 19*s.* 8*d.* per 1,000 cubic feet capacity. Another large gas-holder and tank, designed by Mr. Levesay for the South Metropolitan Gas Company, and which are believed to be the largest in existence, cost 47,000*l.* The capacity is 5,500,000 cubic feet, which is at the rate of only 8*l.* 10*s.* 8*d.* per 1,000 cubic feet.

The volume is illustrated by thirty folding plates, and, as is usual in Messrs. Spon's publications, are drawn with the greatest care. Mr. Colyer's meritorious work deserves to be in the hands of engineers and architects who may have to erect gasworks in this country or abroad.

NOTES ON BUILDING CONSTRUCTION. Part II. Second Edition. (Rivingtons.)

When the first volume of "Notes on Building Construction" appeared, we suggested that the work deserved a wider recognition than it was likely to attain, as one of the aids to the examinations of the Science and Art Department. We are glad to know that the three volumes which have been issued are in use among students in architects' offices, and it would be difficult to name a book that so exactly meets the wants of a beginner in the art of building. The second edition is distinguished from the first by two additional chapters. One is on excavations, shoring, and scaffolding. It describes the means adopted for the temporary sustaining of works above and below ground, and some of the principal varieties of scaffolds, derricks, cranes, lewis, &c. The second chapter is on foundations, and gives a general notion of what has to be done in dealing with secure and insecure foundations. The new edition is therefore an aid to that part of the syllabus of the Department which prescribes a knowledge of ordinary methods of timbering excavations, the use of piles in foundations, and the like. It was originally intended that the information should be given in a fourth series of "Notes," for the use of students who are ambitious of attaining honours in the examinations. We hope that the addition of the two chapters is not a sign that the publication of the fourth part has been abandoned. The author has such an ample knowledge of the science and practice of construction that he can hardly give the public too many books on building.

A MANUAL OF RULES, TABLES, AND DATA FOR MECHANICAL ENGINEERS. By DANIEL KINNEAR CLARKE, C.E. Third Edition. (Blackie & Son.)

The massive volume of a thousand closely-printed pages which Mr. Clarke compiled is of as much utility in an engineer's office as the "Imperial Dictionary" (which is likewise published by Messrs. Blackie) is in an ordinary library. The most tenacious memory could not at once recall the formulæ and tables which are needed in the profession from time to time, and in Mr. Clarke's "Manual" everything is found that is required for daily or for occasional reference. Practical geometry, mensuration, trigonometry, mathematical tables, weights and measures of all countries, weights of materials used in construction, mechanical principles, fuel, steam,

strength of materials, mills, gearing, the steam-engine, air machinery, hydraulics, friction, are among the subjects which are treated, and the entire of the information upon them is derived from the books and papers of engineers who are esteemed as specialists. The possessor of the volume has, in fact, an encyclopædia of engineering, and one in which speculation has been superseded by the results of practical experience in all parts of the world, and which have undergone many tests. In the list of authorities from whom information has been obtained we find the names of the foremost engineers of the nineteenth century. A book of this kind is beyond criticism, for it would be absurd in any individual to assume more knowledge on one of the subjects, much less on all, than is condensed in the pages. The third edition embodies the suggestions which have been offered to Mr. Clarke, as well as any late addition to engineering science. The reader has the satisfaction of knowing that whatever is stated in the "Manual" can be adopted with safety in dealing with materials, engines, or structures.

## WORKS IN PROGRESS.

**Messrs. Le Grand & Sutcliffe**, of London, have fixed seven additional Norton's registering turnstiles at the International Health Exhibition; these, together with those supplied by the same firm for the Fisheries Exhibition last year, will make up twenty entrances, and, with the provision thus made, it is calculated the visitors can readily enter in a steady stream at the rate of about 10,000 per hour.

**Artesian Wells.**—Amongst the contracts which Messrs. C. Isler & Co. have at present in hand, an 8-inch artesian bored tube well is being fixed at Messrs. Brooks, Shoobridge & Co.'s Cement Works, Grays. Among other works may be mentioned their new patent improved turnstile. The chief improvement in this is in the "clutch" arrangement, which is cast with four teeth, the bottom part being dovetailed so that when the machine is worked the lock is perfect, and not as with the old-pattern turnstile, which is worked by a foot lever; the whole pressure being put on it, this occasions frequent breakages, which cannot by any means happen with the new turnstile, as the whole pressure is put direct on the spindle. The clutch rides freely on the square part of the spindle, and gets released by a fork, which lifts it from a ridge cast on the top clutch. It also can be worked right or left, without disturbing the turnstile, but simply reversing the ratchet wheel in the top box.

**Messrs. J. Stott & Co.** have recently fitted their patent gas governors throughout Dover Castle and Barracks, the Milton Barracks, Gravesend; Chatham Convict Prison, the Wandsworth Prison, the Clerkenwell Sessions House, and York Castle; also the Warwick County Lunatic Asylum, where, in six months' time, a saving of over 60*l.* was effected, while cost of governors was only 82*l.*

**The Æolus Waterspray and General Ventilating Company, Limited**, whose business has passed into the hands of the late engineer of the Company, Mr. R. Oakley, 235 High Holborn, have recently applied their system with complete success to the Royal Academy, under the direction of Mr. Norman Shaw, R.A.; the Beckenham Town Hall, under Mr. George Vigers, and the banqueting hall of the Mercers' Company, under Mr. G. Baines Williams. Mr. Oakley has just received instructions from the Ecclesiastical Commissioners to apply the same system to the church of St. Peter's, Limehouse, under the direction of Mr. Ewan Christian.

**Dundee.**—The extension of the Harbour Trustees' Offices, and provision of a new board-room, has been completed from the designs of Messrs. C. & L. Ower, architects. The cost of the whole of the alterations, extension, and improvements is about 2,000*l.* The following are the contractors:—J. & C. Hay, masons, Dundee; A. Bremner, joiner; A. McRitchie, plasterer; D. Ramsay & Co., plumbers; Laburn & Lindsay, slaters; Gray & Dickson, G. H. Nicoll, and W. Johnston (Glasgow), ironmongers; Thomas Justice, J. Blacklaw, and E. Wilson & Son, cabinetmakers; J. Mackay & Son and D. Pirie, painters; Westwood, Son & Miller, blinds; J. Bryden & Son, bellhanging; Lion Foundry Company, railing.

**Mr. Frederick Sage**, of 80-84 Gray's Inn Road, has secured a large contract for show cases and office fittings at Messrs. Silber & Fleming's new premises, rebuilding in Wood Street, E.C.

**The Improved Wood-Block Flooring** of Messrs. Geary & Walker (late Andrews & Co.), of 7 John Dalton Street, Manchester, known as Geary's patent "Premier" system, is, we understand, being largely employed in many and various works of considerable importance, including hospitals, public offices, banks, clubs, churches, schools, &c. The advantage which the patent system offers in providing against what has hitherto greatly detracted from wood-block floors—the liability of the blocks to work loose—is worthy of notice. The blocks are secured to their

foundation by metal "keys" in such a manner that it is absolutely impossible for them to be disturbed by any ordinary means. Further, the special process which the blocks undergo is a certain preventative of dry rot, and they are laid so as to be perfectly impregnable to dampness. A system of wood-block flooring which possesses these advantages must, we imagine, be a success; and the merits of this "Premier" system are, we hear, being duly recognised by well-known architects. That wood-block floors are in every respect preferable to the ordinary floors cannot be doubted. It is certain they are now adopted more generally than formerly; and now that a proper method has been devised of "keying" the blocks, it will undoubtedly lead to the more frequent use of an effective and admirable flooring.

**Messrs. Suffling & Co.**, 143 Edgware Road, have just brought out a novelty in the way of stained glass. It is called the "Aquarium Window Screen." Fish of all kinds are painted on greenish tinted glass in such a manner as to give them the appearance of swimming in an aquarium surrounded by shells, rock, weeds, &c. This is environed by a margin of ruby and green glass, and the whole, when placed in a mahogany or oak frame, makes a very handsome screen for a dining-room or library window.

**Messrs. Hayward, Tyler & Co.**, of Whitecross Street, London, who five years ago erected the extensive sewerage pumping machinery of the Twickenham Local Board, for raising one and a half million gallons daily to a height of 60 feet (or 100 feet if required), have now contracted to supply and erect another large steam-pumping engine in the same works, to meet the increased demand of the district. The pumping machinery already at work has, we believe, performed its functions since its first starting without a single hitch, in spite of exceptional demands upon its capacity during wet seasons. Interesting drawings of this machinery are exhibited at the International Health Exhibition.

**Messrs. R. Waygood & Co.**, of Falmouth Road, Great Dover Street, have received an order from Messrs. Maple & Co. to supply one of their Patent Balanced Passenger Lifts at their premises, in addition to the other lifts now working there. Messrs. Waygood & Co. have also received the order for passenger, luggage, coal, and dinner lifts, with engines, boilers, pumps, &c., for Prince's Hotel.

## CHURCH BUILDING AND RESTORATION.

**Carlton Colville.**—The parish church has been reopened after restoration, which has been carried out under the direction of Mr. Howard Gaye, architect, Sevington Street, London. The cost of the works has been about 2,500*l*. Mr. Robert Morriss, of Ditchingham, was the contractor, the stonework being executed by Mr. Allen, of Beccles.

**Sale.**—The foundation-stone of the Roman Catholic church of St. Joseph has been laid. The building will provide accommodation for 400 persons, and is being built from the designs of Mr. W. H. Rawle, architect, the materials employed being red brick and terra-cotta.

**Helensburgh, N.B.**—A new Congregational church has been opened. The building consists of nave and chancel, together 87 feet long, and one side aisle, separated from the nave by an arcade supported on clustered columns of polished Peterhead granite, with richly carved capitals. The gable of the old church serves as the side wall of the aisle along the greater part of its length, so that there is only one window in the aisle; but there is no want of light, as the coupled lancet windows on the opposite side are lofty. The pulpit stands close to the east wall and behind it are benches for the choir. The pulpit is of oak, and is enriched with carving executed by Mr. John Craig, who also made the choir bench ends. What may be called the chancel is lighted by two lancets on each side at a considerable height from the floor, and by a wheel window in the gable filled with coloured glass, by Mr. Miller, of Glasgow. At the west side a small door gives access to the vestry, and near this in the aisle is a door of egress which also gives access to the old church, the vestry, and waiting-rooms. The roofs, and a small gallery at the end, next Princes Street, are of dressed timber darkly stained. The pews and other fittings are of pitch pine. The principal entrance is by a porch at the end of a side aisle next Princes Street. This and the gable adjoining are the principal architectural features of the exterior. The porch has a highly decorated doorway, with detached shafts in the jambs, with carved capitals, and a good deal of ornament in the arch mouldings. The inside is faced with ashlar, and there is a bench table on which rests arcading with detached shafts. The floor is of encaustic tiles. The gable towards Princes Street has a large four-light window, with tracery of a simple geometrical design, in keeping with the architecture throughout, which is that of the style which prevailed in the latter part of the thirteenth century. Beneath the window-sill an arcading extends between the buttresses. The width of the nave is 28 feet 6 inches, and the highest part of the roof exposed to view is 35 feet. The pews will accommodate 550 persons, allowing 20 inches to each. The contractors

were—John Jack, mason; Wm. Jack, wright; D. Dempster, slater; Wm. Thomson, plasterer; John Horn, plumber, all of Helensburgh. The carving was done by Mr. James Young, of Glasgow, and the painting by Messrs. J. W. McCulloch & Son, of Helensburgh. The heating apparatus is by Mr. Charles Ritchie, of Edinburgh. The architect is Mr. John Honeyman, Glasgow.

## SCHOOL BUILDINGS.

**Aston.**—New schools for Erdington. Six sets of designs were submitted in limited competition for the above, and on the award of Mr. E. R. Robson, F.S.A., architect to the London School Board, the designs of William Henman, A.R.I.B.A., of 38 Bennett's Hill, Birmingham, were selected, subject to a suitable tender being obtained within the stipulated expenditure of 3,500*l*., which had to include the school building for 460 children in two departments, a caretaker's residence, covered playground, the asphaltting of the whole of the playground, boundary walling, &c. On the invitation of the Board fourteen builders submitted tenders: that of Mr. W. Bennett, of Lozells, amounting to 3,277*l*., being the lowest, has been accepted, and the work is to be proceeded with so soon as the sanction of the Educational Department has been obtained.

**Bamber Bridge.**—New Wesleyan schools are about to be erected at Bamber Bridge, near Preston, from the plans, and under the superintendence of, Mr. David Grant, architect, Preston. Suitable accommodation is provided for 300 boys and girls and 100 infants, with ample and separate playgrounds.

**New Clee.**—New schools are about to be erected at New Clee, Great Grimsby, in connection with St. John's Church, for 300 children, from the designs of Mr. E. W. Farebrother, A.R.I.B.A., architect, Grimsby.

## GENERAL.

**The Private View** of the Summer Exhibition of the Nineteenth Century Art Society will take place to-day, Saturday, the 24th inst.

**The Royal Scottish Academy Exhibition**, which was opened in the beginning of February in Edinburgh, closed on Saturday last.

**The Death** is announced of M. Gustave Jundt, the well-known artist. M. Jundt was born in 1830 at Strasburg, and studied painting under Gabriel Guerin and Drolling. His best known pictures are the *Iles du Rhin*, *The Libellules*, *Retour de la Fête*, and *Dimanche Matin*.

**A Bronze Statue** is proposed to be erected in Derby as a memorial of the late Mr. Bass, and large sums of money have been already promised towards this object.

**Vosmaer's novel**, "*Amazone*," is about to be published in English. The translation has been made from the third Dutch edition, and arrangements have been made with Mr. Alma Tadema, R.A., by which the frontispiece originally drawn by him for the author will be used for the English edition.

**The Derbyshire Archæological Society** visited Southwell Minster on Saturday last, when the Rev. A. Sutton read a paper on the history and architecture of the building.

**The International Forestry Exhibition Buildings**, Edinburgh, are to be extended for nearly 6,000 square feet of space, mainly in consequence of a requisition from the Japanese Legation.

**The Italian Government** has concluded, through Professor Villari, the negotiations for purchasing the Italian manuscripts in the Ashburnham Library. The amount to be paid for them is 23,000*l*.

**The Monmouthshire County Magistrates** have instructed Mr. William Tanner, the county surveyor, to prepare plans for the erection of police buildings and court at Newport, at an estimated cost of 4,000*l*., and a new police-court at Chepstow.

**The Surveyors** of the Whitechapel Board of Works, who were commissioned to examine the new parish church of St. Mary, report that the building is in a state of disintegration, as demonstrated by numerous cracks and fissures and separation of main walls that have been going on steadily from week to week, these fissures varying from a hair's breadth to a quarter of an inch above ground.

**Govan.**—Contracts have been entered into for forming and enclosing the park which Mrs. John Elder intends presenting to the people of Govan, and for the erection of waiting-rooms, keeper's house, &c., and the construction of a large pond for model-boat sailing; and it is expected that the work will be finished in the autumn. The contractors are:—For cast-iron railings and gates, George Smith & Co.; for malleable ironwork, A. & J. Maise & Co.; for buildings and pond, Thomas Brown; and for forming roads, drainage, &c., John Murray. The whole is being carried out under the direction of Mr. Honeyman, architect, Glasgow.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, MAY 24, 1884.

### COMPETITIONS OPEN.

**BURNLEY.**—July 1.—Plans are required for the Erection of Municipal Buildings, Police Courts, and Baths. Premiums of 200, 100, and 50 guineas. Mr. J. E. Stafford, C.E., Borough Engineer, Burnley.

**DERBY.**—June 2.—Designs are required for the Erection of a Pauper Lunatic Asylum for the Borough at Rowditch. Premiums of £100, £75, and £50. Mr. Thomas Coulthurst, Borough Engineer, Full Street, Derby.

**LEEDS.**—Plans required for Converting Gas Offices, Boar Lane, and Ground behind, into Restaurant, Hotel, and Bodega. Mr. John Milling (Messrs. Milling), Leeds.

**LLANELLY.**—May 31.—Plans are required for a School in Three Departments (Boys, Girls, and Infants). Mr. J. Jennings, Clerk to the School Board, Llanelly.

### CONTRACTS OPEN.

**BRADFORD.**—May 29.—For Building Two Wings and other Additions to the Eye and Ear Hospital. Messrs. W. & R. Mawson, Architects, Exchange Buildings, Bradford.

**BUCKIE.**—May 26.—For Building Dwelling-house and Offices. Mr. G. A. Bruce, Architect, Banff.

**COLNE.**—May 29.—For Construction of Reservoir on the River Laneslaw. Messrs. Bateman & Bill C.F., Albert Chambers, Albert Square, Manchester.

**COVENTRY.**—May 31.—For Alteration of Britannia Hotel. Mr. W. Langley, Architect, 18 Smithfield Street, Coventry.

**DERBY.**—May 28.—For Building Studies, Dining-hall, and other Premises, Repton Hall. Mr. John Shaw, The College, Derby.

**EARLSHEATON.**—May 27.—For Building Wesleyan Chapel. Messrs. Kirk & Sons, Architects, Dewsbury.

**ELLAND.**—May 29.—For Building House. Messrs. Horsfall & Williams, Architects, Post Office Buildings, Halifax.

**FENNY STRATFORD.**—May 24.—For Works to Tower and North Aisle of St. Martin's Church. Mr. E. G. Bruton, Architect, 17 New Hall Inn Street, Oxford.

**HALIFAX.**—May 28.—For Pulling down Inn and Building Three Shops, Offices, House, &c. Mr. C. F. L. Horsfall, Architect, Lord Street Chambers, Halifax.

**HARPURHEY.**—May 24.—For Building Twelve Houses and Shop. Mr. Frank Richards, Architect, Venice Chambers, 61 Lord Street, Liverpool.

**KING'S LYNN.**—May 26.—For Erection of Buildings for Young Men's Society. Mr. E. J. Colman, Architect, Market Place, Lynn.

**KINGSBURY.**—May 26.—For Building Schools, Lavatories, &c. Mr. William Owen, Clerk to the Kingsbury School Board, Cliff, near Tamworth.

**LEEDS.**—May 26.—For Building Caretaker's House at South Accommodation Road Board School. Mr. R. L. Adams, Architect, Imperial Buildings, Bond Street, Leeds.

**LICHFIELD.**—May 27.—For Alterations and Additions to Ogley Hay and Sheffield Board Schools. Mr. T. H. Fleeming, Architect, Waterloo Road, Wolverhampton.

**MARKET RASEN.**—June 7.—For Works to Parish Church Tower. Messrs. Charles Kirk & Sons, Architects, Slough.

**OLDHAM.**—May 27.—For Building Station at Mumps. The Engineer's Office, Hunt's Bank, Manchester.

**SEATON, DEVON.**—May 31.—For Extensive Additions to Beach House for an Hotel. Mr. Eggar, Architect, 57 Gower Street, Bedford Square, London.

**STOCKPORT.**—June 2.—For Alteration of Bank Chambers for Extension of Free Library. Mr. Peter Peirce, Architect, St. Petersgate, Stockport.

**STOURBRIDGE.**—May 28.—For Building Engine-house, Boiler-house, and Stack for Pumping Station. Mr. Harry Mills, 118 High Street, Stourbridge.

**WARDLEWORTH.**—May 27.—For Building Warehouse and Additions to Station. The Engineer's Office, Hunt's Bank, Manchester.

Willenott . . . . .	2,300	0	0
Curnow . . . . .	2,253	0	0
Miller . . . . .	2,250	0	0
Oldrey . . . . .	2,200	0	0
Nash . . . . .	2,060	9	0

#### ABERGAVENNY.

For Building Villa Residence, Abergavenny. Mr. E. A. JOHNSON, Architect, Abergavenny. Quantities by the Architect.

FOSIER, Abergavenny (accepted) . . . . . £2,118 0 0

For Building Cottage Villa, North Street, Abergavenny. Mr. E. A. JOHNSON, Architect, Abergavenny. Quantities by the Architect.

Stephens . . . . . £330 0 0

Foster . . . . . 310 0 0

SHEEN (accepted) . . . . . 307 0 0

For the Construction of Boundary Walls, Footpaths, &c., at Bailey Park, Abergavenny, Mon. Mr. E. A. JOHNSON, Architect, Abergavenny.

THOMAS, Abergavenny (accepted) . . . . . £780 0 0

Entrance Gates and Railing.

HAMPSON & BROMLEY, Abergavenny (accepted) . . . . . £243 0 0

New Side-Fence Railing and Shrubbery Enclosure.

DAVIES, Abergavenny (accepted) . . . . . £239 0 0

#### BRIXHAM.

For Erecting Eight Houses, Brixham, Devon, for Mr. Pearce. Mr. G. SOUDON BRIDGMAN, Architect, Torquay.

Blatchford & Lea . . . . . £2,004 7 7

Wills & Tilley . . . . . 1,760 0 0

Rundle . . . . . 1,729 0 0

Conch & Patient . . . . . 1,698 0 0

HAZLEWOOD BROS., Brixham (accepted) . . . . . 1,689 0 0

#### CHUDLEIGH.

For Schoolmaster's Residence, Chudleigh, Devon, for Mr. W. Rouse. Mr. G. SOUDON BRIDGMAN, Architect, Torquay.

RABBICH, Chudleigh (accepted) . . . . . £297 10 0

For various Works for the Right Hon. Lord Clifford, Ugbrook Park, near Chudleigh, Devon. Mr. G. SOUDON BRIDGMAN, Architect, Torquay.

Hayes Farmhouse.

GILLIARD & BOVEY, Kingsteignton (accepted) . . . . . £495 0 0

Foster Villa Farmhouse.

YEOMAN, Kingsteignton (accepted) . . . . . 245 0 0

Upcott, Cattle Sheds.

BALL & SHAPLEY, Chudleigh (accepted) . . . . . 120 0 0

Waddon, Cottage.

BALL & SHAPLEY, Chudleigh (accepted) . . . . . 186 0 0

Waddon, Granary.

WIDDICOMBE & BARBAGE, Chudleigh (accepted) . . . . . 76 9 0

AWARDED SEVEN PRIZES FOR SUPERIORITY, INCLUDING PARIS GRAND MEDAL, 1878, THE CERTIFICATE OF MERIT OF THE SANITARY INSTITUTION OF GREAT BRITAIN, AND THE AWARD OF MERIT AT THE INTERNATIONAL EXHIBITION, 1881.

TO ARCHITECTS.—THE BRICK of the FUTURE, that shall not get dingy or sooty like other Bricks, but, being of a **Semi-Vitreous** nature, will maintain a clean and washable surface.

## FACING BRICKS AND BRICK ORNAMENT

## TRUE TERRA-COTTA,

AS ALSO ARCHITECTURAL WORK,  
IN WHITE AND WARM-TINTED BUFF.

Made from the Finest Terra-cotta and Stoneware Clays, of a warm and pleasing appearance, of beautiful and superior quality and finish, non-absorbent, acid, fire, and alkali proof, will resist the most severe frosts, and when tested were found to withstand a pressure of 445 tons to the square foot. They have been used in the most exposed parts on the North and South Coasts, and being true Terra-cotta, are warranted imperishable.

Pattern Sheets and Price Lists of superior Glazed Stoneware Sanitary Pipes, and Fire Clay Goods, Chimney Tops, &c., on application.

Sole Manufacturers:—CANDY & CO., Limited, GREAT WESTERN POTTERIES, NEWTON ABBOT, and 11 QUEEN VICTORIA STREET, LONDON, E.C. Who are also Sole Makers of the celebrated "Granite Vitified" Paving Bricks for Yards, Stables, and Footpaths, and "Granite Vitified" Damp-proof Building Bricks, as used by H.M. Government for dock construction, &c. Samples free to Architects and Engineers.

# The Architect.

## SOME PRACTICAL RESULTS OF THE CONFERENCE OF ARCHITECTS.

HERE ought, of course, to be some practical good done as the outcome of a general professional gathering like the Conference of Architects which has just been held. It is true it was not numerously attended. Perhaps the attendance was not even so representative as it might have been. Except at one of the meetings—the very odd meeting, many will call it, of the Associates of the Institute—there was but little enthusiasm manifested. The subjects selected for discussion were not often of a promising order. There was a remarkable absence of the leaders—if there are any leaders now—of the London profession. In almost every sense, perhaps, the Conference was not worthy of the name. And yet it would be most unlikely that it should result in nothing, even if it were not much better—and we do not think it was—than a fortuitous concourse of atoms architectural. For indeed there is so much that wants doing in the architectural world of England just now, that for twenty or thirty architects to meet together without doing something is almost impossible.

There is this peculiarity, moreover, about our architectural conferences, that they take something like the form of the popular meetings, of the minor sort, that are held in Trafalgar Square. Anybody may come and go as he pleases, and everybody may say his say if he can. Artist architects from both town and country, business architects, archæologists, amateurs and foreigners, surveyors, builders, auctioneers, assistants, pupils, and all sorts of accessories to architecture, real or imaginary, outsiders or insiders, are equally welcome to listen, and equally welcome to talk. Those who consider this a sign of weakness may console themselves, however, on the present occasion with the reflection that the results of the medley have been unexpectedly significant. For, although the meetings of the Conference were, as a rule, neither large nor representative, there can be no doubt that they were both earnest and authoritative: the right men were there, and they made themselves heard.

A more unpromising subject than "the duties, obligations, and mutual relations of architect and contractor, with reference to English and foreign practice," could not very well be hit upon for starting such a Conference. It was not at all likely that any other country could in these days teach England a lesson in the art of commercial contracts; except, perhaps, America or Australia, whose arrangements after all might only be a little too pronounced in sharp practice, of which we have enough. Not long ago someone told us of the Australian way of receiving tenders from builders. The Australian architects do not open the sealed offers, as ours do, in the presence of the competitors or their representatives, who solemnly take down the figures and send them to the journals for publication; the tenders are opened in private, the most favourable is selected, the contract is signed, and *then* the figures are divulged! Even the Americans, after this, may probably feel almost disposed (in their own phraseology) to "take a back seat"; but in England it is more to the purpose to say that the architect who indulged in such a pleasantry might come before long to hear the opinion of a court of law upon it. In France and Germany, on the other hand, and Spain (for some inexplicable reason quoted) it was not to be supposed that an English contractor would find anything to better his position; and, in short, the outcome of the discussion was simply this—that the English mode of bargaining is clearly the best, and can scarcely be improved upon except in one respect, namely, that the bill of quantities ought to be made the basis of the contract, and speculative risks, as far as possible, thus avoided. One other point was made in connection with this: that an architect, especially in the country, must be allowed to be his own quantity surveyor if he thinks fit, provided of course the work be honestly and efficiently done. These two principles, indeed, may be said to have been unexpectedly established by the

Conference; and many of our readers will see at once that they constitute two very important and significant steps in advance in the direction of liberality of practice. It was only the other day that the Council of the Institute took upon itself, wholly without authority, to publish the outrageous intimation that a member who participated in quantity-work would run a risk of being arbitrarily expelled; we apprehend this is now to be forgotten as an accidental error. On the other hand, the builders have been clamouring for years in vain for the introduction of the bill of quantities into the contract, and now they are practically at liberty to insist upon it.

The education, or want of education, of the English architect, and the long-debated question of giving him a professional diploma, constituted what appeared to be something more attractive as another subject for discussion; but we cannot say that very much was accomplished here in the direction anticipated. The French system was almost exhaustively explained once more, and a sufficiently full account was added of the German system. No doubt could be entertained of the great superiority of both so far as regards academical training, nor could it be denied in either case that the honour and glory of academical recognition are sufficiently developed. In Spain it was discovered that "throughout the length and breadth of the land no one can practice as an architect who has not received the diploma of the Architectural School of Madrid," an ordinance which seemed, even to the most sanguine of our votaries of the diploma, to carry the matter a little further than might be quite practicable, or even perfectly convenient, in England. In short, it was pretty fairly explained that the Continental habit of dragooning—outdragooned in the peninsula—to which Englishmen have such an inveterate dislike, is made to exercise in such a thing as architecture an influence which is thoroughly characteristic, to say the least. But when closely looked at, what comes of it? The drill, no doubt, is most effectual, so far as drill goes. The uniformity of mind which some of us admire so much, and more of us so little, is no doubt exceedingly well accomplished. But, after all, was it not clear—unexpectedly clear indeed—that our English no-education could still hold its own? Granting all that was claimed—actually everything that could possibly be claimed—for the system of eight or ten, or even fifteen years' drill on the Continent, the common sense of the meeting could not help reverting to the English plan as being both more businesslike for the public and more satisfactory for the individual. The Frenchman, as was truly said, is a little too willing now and then to work for "*la gloire*"; the German, it might have been added, is equally led away sometimes by the attractions of mere scholarship; and if both fly over the head of the Englishman, so let them fly. Our practical office pupilage, in short, in spite of all that could be said against it, was found to be on the whole the right thing for the practical character of English architectural work. No one need wish to deny the fact that we could take a little more scholarship from the Germans, and a good deal more manipulative dexterity from the French, and no one need hesitate to advocate the adoption of measures to bring about both better instruction and a better recognition of it; but here again an unexpected result of the Conference was that it left us better satisfied with our own way than any one could have thought we ought to be, and we shall probably for some time to come hear less of the necessity for either *ateliers* or diplomas. That we ought to have schools and examinations is another question; and so far the opinion of the Conference was unmistakably in the affirmative.

On "the Tenure of Land for Building Purposes," although here again the subject seemed peculiarly unpromising, it may be said that what came about was once more both unexpected and significant. The debate upon this question was in some respects the best of all; and some very plain truths were told, perhaps the more readily because the paper which led the discussion was intentionally made a little too void of offence. That the leasehold system of tenure has many inconveniences attached to it was made very plain. But how to improve upon it was certainly not made so plain. Perhaps we may say that the difficulty of dealing with the question of specific improvement was what became most prominent as the result of the debate. The law of property in land, everywhere and under all conditions, even the most primitive, is a purely conventional disposition of things which cannot avoid offending somebody; and it may be said that, the more complex and intricate the

circumstances are, the more open to abuse do the arrangements become. We cannot help this. But the case is all the more manifestly one for continual legislation: the ordinary principles of free trade do not seem to apply. As an illustration, take the operation of the recent change in the game laws. It used to be held that the squire and his tenant ought to be left entirely free to make their own bargain in their own way. The result was that the squire ate up the tenant's crops, and still asked for his rent. The Legislature interfered, and the immediate result is that the farmers now tell the landlord who "reserves" the game to "reserve" the land as well. Legislation something like this seems to be becoming necessary for London as regards building leases. But what shape it ought to take is not yet clear, and this is the result with which for the present we may be satisfied; the question at any rate is on the move.

In spite of all drawbacks, the recent Conference of Architects, in these and some other matters, has done sufficiently good work to induce us to be thankful, and to express a hope that the next may be convened at an early date, and that it may be much more carefully organised for the attainment of definite ends. The very remarkable *authority* which a free and open public gathering somehow acquires has in the present instance been fully illustrated.

## EXHIBITION NOTES.—THE ROYAL ACADEMY.—II.

THE report goes that an unusual amount of good average landscape work had to be rejected this year by the Academy owing to pressure on space. Of "nice studies of birch trees and water," after the manner which ushered Mr. ERNEST PARTON into notice, there was quite a flux, for instance. What difference a more liberal admission might have made we cannot say, but certainly the present exhibition is not distinctive for landscape excellence, although a great deal of fairly meritorious quality is to be found. Some of the best stuff in this kind belongs to the school of landscape genre, as in the poetic pastoral by Mr. R. W. MACBETH, *Fen Farms*—a girl calling the cattle home at eventime, when the light is soft upon slow winding river and low banks; and, again, in TOM LLOYD's glowing picture of reapers at work cutting *The Golden Grain*; and in the delightful incident of summer days on the Thames, *Benson Ferry*, a somewhat new departure, by G. G. D. LESLIE, R.A.; and yet another sunny river scene by Mr. GREGORY, A., *Intruders*, a small but masterly study of swans disturbing two girls, of whom one stands on the landing-stage, and the other sits in a boat beside a boat-house in a green nook. Mr. LEADER, A., and Mr. KEELEY HALSWELLE abide with rather tiresome fidelity to subjects and effects of which they have made a specialty. The latter in weeds, water, and heavy clouds, the former in sunset over low lands, glistening with flood or recent rains. Mr. LEADER's *Glebe Farm on the Welsh Border* is, however, a solidly painted and faithful picture, with that breadth and unity of effect which is wanting to so much of the picturesque landscape study of younger men. The colouring of Mr. W. B. DAVIS, A.R.A., has of late years affected an over lurid iridescence, but no one composes a landscape of lake and hill under irradiating glow of midday or sunset with more thorough knowledge and management of material. *On the Hillside Clearing after Rain* is admirably atmospheric. The same cannot be said of two ambitious pictures by Mr. PETER GRAHAM, R.A. *Dawn* is a flashy performance, without truth of scale or relation; and the better picture of the two, *Sea Mist*, has a flimsiness that makes one regretfully remember the sturdy work with which first the Scotch artist startled the Southerners. One of the steadiest of the school north of the Tweed is Mr. JOHN SMART. *The Land of the Macgregor* has been hung high in the central room, but its somewhat scenic vigour makes it tell. We have marked an impressive picture of the English lake country, *Nightfall under Crossfell*, by Mr. T. H. MCLACHLAN, whose name seems to have come from over the Border. Mr. DAVID MURRAY, an Edinburgh artist of repute as a landscapist, has taken good place in our exhibitions this year, claiming the line at the Grosvenor and Burlington House, and winning the honour of a purchase under the Chantrey bequest. There is more finesse and detail about his reading of nature than is common to his countrymen. He does not generalise, though he may eliminate, and the effects

ready to hand and easiest to apprehend are not those which charm him most. Perhaps the excellence of his drawing is best shown in the work selected by the Academy, *My Love is Gone a' Sailing*, which challenges successfully difficulties of a wide range of view over a country of broken levels and diversified character; but the somewhat hot and brilliant palette of the painter deals with a romantic and lovely scene in the sunset glow over *Loch Linnhee*, while the charm of a significant tree touch is felt in the Grosvenor picture of autumn woods, entitled *Leaves have a Time to Fall*.

MISS MONTALBA's Dutch pictures are full of that charm of character and swift security of effect which belong to her talent. Only one has gone to the Academy, *Middelburg*, a picturesque agglomeration of red and brown roofs, walls, and trees, all aglow in orange evening light. The style is not of the English school, and is the more welcome, as landscapes painted under Continental influence, Impressionist or other, do not abound this year.

A few pictures directly from French studios have found their way to the walls, notably *La Nuit*, by M. BOUGUEREAU, a graceful floating figure in a somewhat vaporous manner, well known through photographs; and a clever portrait of a child in a pink dress, seated in a red wooden chair, *L'Enfant Rose*, by M. AUBLET. There is a curious picture by M. SOLOMON SOLOMON, *Ruth and Naomi*, hung high in the eighth gallery, which aims at certain effects of luminous pallor of tone and dreamy sentiment in accord with the more sentimental section of the Impressionist painters. There is undoubtedly a certain power in this work, and we are glad to meet again with an artist who drew our attention first in the winter oil exhibition at the Institute gallery, by a striking picture of an Eastern mother with a sick boy stretched naked across her knees. The woman held in her hand a bird, while drapery and flesh tones were all pale, yet brilliant, in the white glare and opal shadows of tropical light.

The water-colour drawings at the Academy are unusually good this year, possibly in prospect of the more honourable treatment which this branch of art is to receive in the new rooms now in course of construction. Of black-and-white work the same praise cannot be given; the etchings are disappointing, in spite of some good plates from Messrs. STRONG, MENPES, WYLLIE, AXIL HAIG, &c., and of cartoon designs for decorative purpose there is nothing worth mention.

In the sculpture gallery there is certainly not the usual hopeless array of mediocre work in portrait busts, choking out other and more individual efforts, and there are one or two pieces of real energy and knowledge. The chief place still belongs to the heroic rustic of Mr. HAMO THORNECROFT, A., on which we commented in studio notes. The figure tells exceedingly well in the more trying position at the Academy, and by its manly and well understood modelling and definite conception, contrasts favourably with the feeble work around. Some stir has been made about the promise of a young sculptor, Mr. ALFRED GILBERT, whose bronze head of an Arab we noted last year with interest. *A Study of the head of an old man in bronze* is a piece of close and careful manipulation, after the style of certain Roman busts—the well-known *Julius Cæsar* for instance; the small bronze figure of *Icarus*, balancing himself with the artificial pinions fastened on his arms, stretched down in line with the torso, is a clever design, with a certain fire and decision about it that remind one of the Italian MONTEVERDE. A strong point in Mr. GILBERT's claim to notice is the courage of his tooling. Mr. LAWSON's gladiator, *Ave, Cæsar*, halts, as usual with his work, on the edge of success. Mr. BIRCH, A., exhibits *Lady Godiva*, standing beside her horse before the celebrated ride—an enormous group, of which its size is the most noticeable feature, except we include the ill-studied proportions of the horse and lack of charm in the general lines of composition. Mr. WOOLNER, R.A., sends a graceful high relief of a girl, *The Water Lily*; Mr. CALDER MARSHALL, R.A., a fainting *Psyche*, a very material version in the nude of that Greek type of virgin passion. Mr. POYNTER, R.A., comes out in a new *métier* with portrait medallions in low relief, not much to be commended. A chief place is awarded in the central hall to Mr. MULLIN's group of Jacob and Esau, *Bless me, even me also, O my father*. There is a certain vigour here, but a singular want of dignity and of beauty of line; it is, in fact, clumsy though well-intentioned work. In small figures in the round, Mr. ARMSTEAD's *Egypt*, and *The Light of Asia*, by SUSAN CANTON, should be noted. Mr. SIMONDS exhibits the model, studied at the Zoological

Gardens from the life, of his lion for the colossal memorial monument at Reading to soldiers who fell in the Afghan campaign of 1879-80, a conscientious piece of work, treated with large purpose. In the way of animal sculpture, of less ambitious scale, nothing can beat Mr. TROOD's terra-cotta dogs; "*Chummy*" is perfect in its way. The bust portraits most conspicuous for good or for characteristic treatment and for interesting subject are—*Lord Wolseley* and *Mr. Herbert Spencer*, treated in the pugnacious manner of Mr. BOEHM, R.A.; Mr. THORNECROFT's *Samuel Taylor Coleridge*, for Westminster Abbey; *Longfellow*, the model for Mr. BROCK's bust in the Abbey, an heroic head, with flowing locks like the antique Jupiter; *The Late Dr. Pusey*, by GEORGE RICHMOND, R.A., a refined study in the round by the veteran painter; *J. C. Galton, Esq.*, a terra-cotta of a striking physiognomy, by CONRAD DRESSLER; and Mr. S. FRY's bust of *Norman Shaw, R.A.* Finally, we must not omit to note the three large reliefs by Academy students—Messrs. FRAMPTON, PEGRAM, and BATES—in recent competition of the given subject, *Socrates Teaching the People in the Agora*. A considerable similarity haunts the compositions, which are all praiseworthy efforts to master the difficulty of treating many figures on different planes with just relative relief and concentration of design. That Mr. BATES in these important matters is nearest the mark there can be little doubt, as that he has also transmuted the model with most freshness into the Classic type.

#### FRENCH PICTURES AT THE DUDLEY GALLERY.

A SMALL exhibition of unusual interest is opened at the Dudley Gallery, consisting of some sixty pictures of the French school, and a few pieces of minor sculpture. As was the case with the similar collection last year in the same place, the examples gathered are purposely representative of the rather ultra phases of French art which raise curiosity and controversy. That the examples are favourably representative cannot certainly in every case be affirmed. M. ROLL, for instance, was more characteristically, if not so pleasantly, seen in certain *farouche* studies of labourers and grimy children of the forge and the mine than in the large and not remarkable landscape, *The Grassy Path*, of this season, or the coarsely, if powerfully, painted study of a lady, life size, preparing to disrobe on *Return from the Ball*, and presenting the unalluring contours of her bared back to the spectator by the light of dawn, which is seen in reflection of a mirror, grey over the roofs of Paris. Such work as this is simply repulsive literalism, while the repulsive power of that other phase shown at its fullest in the celebrated picture of *A Strike*, has at all events a noble side and artistic purpose.

Literalism in another class of subject, but no less avowed, is displayed in the large canvas, *The First Communion at L'Eglise de la Trinité*, by M. H. GERVEX. This is an "impression" on a very large scale, and does, in fact, with clever management of perspective, present as much as, according to the formula, one would see of such a scene by winking one's eyes at it! That is a swift sensation of the apse of a cold grey church, a golden high altar before which a row of girls in white kneel confusedly together, steps down which three maidens demurely come, and a flutter of gay Parisian ladies and men looking over the stair rail. More than this one does not see, winking or meditative, for it is the most superficial aspect which the painter presents, largely drawn and painted with so broad and scenic a touch, that the little gallery in Piccadilly is all too narrow for a fair view of the picture. Now this kind of spade work is wholly deliberate, and does undoubtedly attain its end. At a given distance the scene has a startling actuality, and is right in relations of tone, colour, &c. But it is entirely without charm or nobility. That M. GERVEX can paint, and that delightfully, is evinced in the little portrait of a fair fragile child in a dark purple bonnet and dress, with touch of pale blue, entitled *Chilly*. Nothing could be more tender and close than the modelling; the drawing of the nervous mouth and eyes ready for tears is exquisite. *The First Arrival, Café des Ambassadeurs*, uses the incident of a lady in Parisian summer toilette, sitting at a window table in the upper floor of a garden restaurant, waiting for her companion, to display much cleverness in the management of cross lights, warm twilight into which the silver of the risen moon falls,

and the glow of artificial warmth from lamps without and within.

The interest of three studies on the racecourse, *During the Race, In the Tribune*, and *Around the Stove*, by M. DE NITTIS, centres chiefly in the artist's extraordinary skill in the use of pastel. With a limited range of colours and the dry, soft surface produced by the prepared chalk, he achieves a deep and solid quality of tone that is amazing. A clever draughtsman to boot, as evinced in the chic pose of the figures and in the perspective of the balcony and racecourse far below in the "*Tribune*" picture, and observant of social manners, M. DE NITTIS provokes one into interest over his realism of frivolous people and ordinary aspects of things.

M. LEROLLE has a more æsthetic aim. He seeks to move by the sentiment of a scene in which nature and man are at one. His pastorals have a largeness, not only of mere scale, but of style. *The Flight into Egypt*, which represents the Holy Family halting beneath the fir-trees of a forest plateau more like Fontainebleau than anything Egyptian, has sentiment, however, which is chiefly gained by the expedient of painting large golden aureoles round the heads of MARY, the BABE, and St. JOSEPH, and thus bringing these figures, which are otherwise quite subservient in the tranquil landscape, into mystic importance. This is not a good example of the artist. M. JOURDAIN, who has truth and *finesse* when he paints luminous little landscapes like *The Road to Quesnoy*, betrays a limited amount of the first, and of the second quality none, when he depicts a somewhat substantial *Dame aux Camellias* recumbent on a sofa, surrounded by birthday tokens of *The Favourite Flower*. The dainty landscape *genre* of M. CHARNAY looks almost out of place among its assailing neighbours. The artist's manner is a little too pretty, but of delicate microscopic detail and playful touch that has no feebleness about it; the result is delightful. Quite another manner, and again of kin to the *Impressionistes*, is that of M. MONTENARD. This artist delights in the white light and amethyst shadows of southern lands. He sees, and therefore draws, by his colour sense; it is not line, but tone, that attracts him—or, if one may put it so, light falling on mass and revealing itself by colour. Thus we have no hard outlines, but brilliant atmospheric effect and colour of radiant harmony. The blue skies palpitate, the land burns, the olive trees are a soft blur of grey-greens and pale stems. It is by laying on the pigment in large touch beside touch that some of the effect is gained. Among English artists Mr. A. STOKES has successfully studied the method, and achieves a brilliance almost equal.

Lastly, we must welcome the admirable portrait of *M. Victor Hugo* by M. BONNAT, lent by the poet himself—a piece of strong and thorough workmanship. The head is pronounced with decision and actuality; the hands, the figure are *en rapport*. This may not be ideal portraiture, but it is wholesome and good art.

#### NOTES FROM PARIS.

IN one of the Notes from Paris which were published a fortnight ago it was said that there never was a year when the selection of the works for the highest honours of the Salon presented more difficulties than 1884. The result of the voting corresponds with that statement to the letter, for it has been found impracticable to obtain a sufficient number of votes to insure the gold medal for any one work in painting, sculpture or architecture. A person who was acquainted with the opinions of French artists could have anticipated that result equally well with the writer. The Salon is generally described as an average exhibition, and average exhibitions are the terror of judges. M. Bouguereau's *La Jeunesse de Bacchus* received the largest number of the votes. The picture has been long in hand, and the writer saw it on the easel two years ago. So much was said about the picture from time to time that the public at last expected too much. Its fame reached England, and an effort was made before the work was completed to secure the painting for exhibition in Bond Street. We doubt if it would have attracted crowds. The jury in painting have been unable to award any first-class medals, but the twelve second-class medals have been voted to MM. De Lalaing, Schommer, Auguin, De Thoren, Kreyder, Bonnefoy, Delahaye, Damoye, Kroyer, Barillot, Escalier, and Durst. The first-class medals in sculpture go to MM. Levillain, Steiner, and Roland. In architecture the winners of first-class medals are M. Albert Ballu, who is represented in the Salon by views of his restoration of the tower of

Solidor, Saint-Servan, and of a mosque in Algiers; and M. Gaspard André, who exhibits ten drawings of a church at Lyons. The second medals in architecture have been awarded to MM. Girette (Casino at Hyères), Nénot, Chancel (design for a theatre), Girault (drawing of the Scaligers tomb at Verona), and Gagey (restoration of Château de Bourbon-l'Archambault). Third-class medals have been voted to MM. Yvon, Espouy, Bernard, Ruprich Robert, and Schay.

The opening of the Meissonier Exhibition on the 23rd inst. may be well described as one of the important events of the season. A more remarkable gathering of notabilities is of late days rarely seen in Paris. In one part of the room the Duc de Nemours might be heard commenting on the picture of *Napoleon III. at Solferino*, which had been lent from the Luxembourg; in another a dozen or more of the French nobility had collected around the artist to congratulate; the critic on one picture was a favourite comedian; while others were described to admiring friends by a famous author. Very few painters can sustain the test of bringing their works together, and in our time no painter has succeeded so well as M. Meissonier. Objections have been raised against the subjects of his pictures. They are said to show little invention, to be photographs in oils, to be repetitions of one another, and so on. In other words, people, instead of being grateful for the existence of so able a man, wish that M. Meissonier had been somebody else. This perpetual comparison of writers and artists with men of a different class is one of the impediments to progress in art and literature. It is as absurd to compare M. Meissonier with, say Eugène Delacroix or Ingres, as to compare a rose and a lily. There are many kinds of art, and in that represented by M. Meissonier, who has surpassed him? Certainly none of the Dutchmen. There is one test which may be well suggested in these columns. What artist has painted architecture with the accuracy of M. Meissonier? It matters little whether it is an arcade in Italian Gothic, or the Tuileries ruins, the interior of a library, or the stable of an inn—all the parts are put on canvas in a way which shows that the artist took a pleasure in architectural details. In other things the same accuracy is visible, and whatever is put down by M. Meissonier may be accepted as trustworthy. He has demonstrated the possibility of combining realism with art, and thus exemplifies one of the aims of his generation. France may well be proud of the man whose work for half a century is now so well represented in M. Petit's gallery.

English visitors to Paris during the autumn have a treat before them. There is to be an exhibition of French terra-cotta, pottery, and glass in the Champs Elysées, on a scale which is without precedent. In fact, everything that is derivable from the soil of the earth, whether a large statue in terra-cotta or a delicate liqueur glass, a service from Sèvres or a stained-glass window, will be represented. One section will be retrospective, and the other will exemplify what French fingers have accomplished of late years. Amateurs have cheerfully responded to the applications, and many of the most valued works belonging to the State will be lent. If the expectations of the committee are realised, as they bid fair to be, the exhibition will be one of the most interesting among the many which have been held since 1851.

"Macbeth," at the Porte St.-Martin Theatre, is fairly successful in attracting audiences, but as yet there is no difficulty in finding a place in that dingy house. It has been said that the tragedy is not well played as a whole, but the statement is unfair to the management. A play of the kind is ill adapted to the methods of French actors, and it is creditable to find so many of the characters well filled. There is no ranting and no spectacular display. It was hardly to be expected that the "gods" could understand the scenes in which the witches appear; but the laughter that is heard in the upper regions of the house should not be taken as a proof of bad acting. In England it is generally considered more prudent to supplement Shakespeare's words with Locke's music, which is an admission that those scenes are not sufficiently impressive to the world in general. M. Richepin has transposed some of the scenes and omitted others, and it must be said that his version of the poetry is the prosiest of prose. There are nine tableaux. The second scene in the first act, in which the wounded sergeant appears, is omitted, and the act ends with the meeting between Macbeth and the king's messengers. On the curtain

rising for the second act, Lady Macbeth is seen seated reading the letter from her husband—a scene which in the original forms part of the first act. The third act is occupied with the murder of Duncan, the fourth with the banquet and appearance of Banquo's ghost. In the fifth we see the meeting between Macduff and Malcolm (the latter being represented by an actress) and the second interview between Macbeth and the witches, which in the original is supposed to take place at an earlier time. The sleep-walking scene forms an act, instead of part of an act. Finally, there is the attack on Macbeth and his death. If it is objected that Shakespeare has been metamorphosed, and is recognisable with difficulty, M. Richepin can reply that on the English stage the poet's text is not followed with fidelity. The scene between the assassins and Macduff's wife and child is always omitted, and generally that scene in which the porter appears. The latter, it may be said, is represented at the Porte St.-Martin, and gives a great deal of amusement to the galleries.

The skill of M. Marais, who acts Macbeth, and the manly and pathetic interpretation of Macduff by M. Volny, deserve the recognition that is given by the audience at the Porte St.-Martin. But it is natural that in Paris the main interest in the tragedy is Madame Sarah Bernhardt's interpretation of Lady Macbeth. The character has been well studied by the actress, and her reading of it is marked by unity and completeness. After reading the letter, which is done deliberately, and during the temptation of Macbeth, we see a woman who, carried away by ambition, has undertaken something of which she cannot see all the issues. She is, as it were, for the occasion a human tigress. When the murder is discovered there is some hypocrisy in her terror, and Madame Bernhardt follows Coleridge in giving emphasis to the exclamation, "What! in our house!" At the banquet scene we see the woman in two aspects. She is curt and authoritative in controlling the guests, and sways them by vigour of will as much as by words, while the aside speeches to Macbeth are whispered with the sympathy and tenderness of which Madame Bernhardt alone is mistress. We can realise that the curse has fallen on her too, although, woman like, she has suppressed her sufferings. The sleep-walking is entirely different from English usage. The queen enters not with slow steps and eyes fixed on the middle of the dress circle, but rather quickly and excitedly, and without a thought of the statuesque. After a few of the sentences are spoken, we see that the recollection of the event overpowers her. She seems to discern the stain of blood upon the floor, and her involuntary scream startles the audience. Then she falls into a chair, and by turns we have realised those marvellous transformations of character which the poet in a few sentences describes. One moment sad, as she thinks of the dead wife of Macduff, then fiercely urgent to Macbeth, then despairing of forgiveness, and finally the fatalist, who knows that what is done cannot be undone. Madame Bernhardt presents so many phases of emotion and suffering, and with such variety of expression, that her sleep-walking scene deserves to be compared with that wonderful romance, so full of defiance and despair, which Tartini once heard the devil play on a fiddle. It is not surprising that there are repeated calls for the actress after this scene. Madame Bernhardt is the central figure of the tragedy, and the curtain might well fall when the cry is heard which announces her death.

On two nights Racine's tragedy, "Bérénice," has been played at the Odéon, and it would be difficult to find a more remarkable contrast to "Macbeth." While one glows with passion, the other is as cold as an iceberg. Racine could not comprehend such emotion as is seen when Macduff pulls his bonnet fiercely over his brow on hearing of the murder of his wife and children. The characters in "Bérénice" stalk on and off the stage, and utter lofty sentiments that recall the declamatory exhibitions of one's school days. It is no doubt very grand, and it is certainly serious; but with all their reverence for their Classics the Parisians have allowed the tragedy to remain for sixty years unacted, and, after the two nights' experience, it is possible that "Bérénice" may remain in retirement for a similar period. How many revolutions, artistic, literary, and political, have been witnessed since it was played in the early part of the century, and how many will be witnessed before the next revival! As the performance is not likely to have been witnessed by Englishmen, a few notes respecting it may be recorded. There are five acts, but the curtain did not

fall until the close of the tragedy, and the only indication of the end of an act was the absence of the actors for a second or two. The action—if such a word can be used—takes place in a cabinet, which characteristically is described as situated between the *appartement* of the Emperor Titus and that of Bérénice, Queen of Palestine; there was consequently only one scene, which was a pleasing room with Ionic columns. The dresses of the actors were inexpensive, but appropriate. It was worth a journey to the Odéon to hear the verses of Racine as they were there spoken; but it would have answered quite as well if the kings and queens and their confidants had been puppets and the speakers invisible. The dramatist thought only of building up lofty rhymes, and he attained that end. In the seventeenth century it was not supposed to be essential that the drama should be a mirror in which nature was reflected.

### AGNOSTICISM IN ART.\*

THE question that was long ago asked by the jesting Pilate is constantly arising in all branches of art, and rarely is it more difficult to give a satisfactory reply than when the question relates to the authenticity of paintings. So many of the great pictures of Europe have been ascribed to men of less eminence than the reputed authors, and the evidence in each case has been so puzzling, that even honest folks who take things on trust are sometimes compelled to ask, with the Roman Governor, What is truth? At the present time the connoisseurs are at loggerheads in Paris about works by Raphael and Corot, and when we find that it is not easy to determine the qualities which belong to a picture by a man who died a few years ago, we may well hesitate before deciding on the genuineness of a canvas which at least is older than the oldest living expert. The *Apollo and Marsyas* which was lately purchased by the French Government from Mr. Morris Moore, as a work by Raphael, is likely to give rise to as much difference of opinion in Paris as it once did in London. After a time the wrangling of experts will be suspended, some years will pass, and it will be renewed; but unless new discoveries can be made, the question whether Raphael worked on the canvas will be as far as ever from a settlement. There are few of the great pictures claiming to have come down from the sixteenth century in the public galleries of Europe which do not also offer opportunities to the sceptic, for it rarely happens that the history of one of those pictures can be traced from the time it left the painter's studio. There is generally some interval on which no light can be thrown, and it is open to everybody to exercise their invention about what was then done. For example, we find works by Giorgione in the public galleries of London, Paris, Vienna, Madrid, and also in private collections, in addition to those which still remain in Italy; yet there is only one work of his, the altar-piece at Castel Franco, of which the authenticity is established by documentary evidence. When this happens in the case of a man like Giorgione, who produced but few works, what is to be said of painters who were the heads of ateliers, and whose works were imitated with or without permission by assistants and others?

The appearance of a critic who is without implicit faith in the statements in catalogues may not be novel, still we may anticipate that the remarks of Signor Morelli will excite a good deal of fluttering among curators and the cognoscenti. There have been sceptics, but it is a long time since one stood forth with apparently such good ground for his doubts. Signor Morelli is apparently, like many another Italian, rather difficult to move, but dangerous while they are active. He has studied the pictures of his countrymen line by line, as if the smallest detail were worth the attention of a patriot. The study seems to have been undertaken without a thought of book-making, and we may assume that Signor Morelli has been forced into authorship by the misstatements which have been published in official catalogues and in books on the history of Italian painting. Seeing in Germany unworthy works associated with the names of great Italians, and injustice done by sacrificing certain artists in order to uphold the reputation of galleries, it was but natural that a man possessed of Signor Morelli's knowledge should be moved, for the sake of fair play, to question the infallibility of tramontane connoisseurship. At the same time, we are made to feel that the duty was not inviting, and is therefore got through as quickly as possible.

While admitting that a foreigner can see some things better than a native, Signor Morelli maintains that an Italian is best fitted to explain Italian art. It is in art rather than in literature that the nature of the people finds truest expression, and an Italian speaking on the subject is therefore in a different position to a stranger. This is true of the art of all countries, whether poetry, painting, or music, for a native is able to describe the art, as it were, from within, and his sympathy gives him insight.

\* *Italian Masters in German Galleries: A Critical Essay on the Italian Pictures in the Galleries of Munich, Dresden, Berlin.* By Giovanni Morelli, Member of the Italian Senate. Translated from the German. (George Bell & Sons.)

Dryden says that "the pencil speaks the tongue of every land," but as in all languages there are idioms in expression and niceties in pronunciation which are almost unattainable for a foreigner, so in art there are local touches in form and colour, in character and incident, which strangers may not observe or appreciate. If, therefore, we find Signor Morelli doubting the genuineness of a picture because he remains unmoved when he gazes upon it, we are not to conclude that he is too hasty in his conclusions, or that the feelings are a less safe guide than the intellect. An artist cannot entirely emancipate himself from his surroundings, and however imaginative or removed from everyday life his subject may be, he is certain to do something which will suggest the time or place of production, or the kind of people from whom he derived his idea of life. But Signor Morelli does not rely altogether on his impression; whenever it is necessary he has recourse to documentary evidence, and investigates the particulars with a lawyer's zest, and as if the point in dispute were the title to landed property.

It would take more space than we can afford to notice all the pictures which are scrutinised by Signor Morelli. A remarkable case is the *Reclining Magdalen*, by Correggio, sometimes called the *Egeria*, in the Dresden Gallery. This has been deemed to be one of the best executed and best preserved of the artist's works. Even a good copy like that belonging to Earl Dudley is accepted as a treasure. Signor Morelli denies that this cabinet work could have been produced by Correggio, and for several reasons. In the first place, he says it is painted on copper, and, notwithstanding all that is alleged to the contrary, no Italian painter employed that material before the close of the sixteenth century. Then the background represents some northern scene, and the foliage is not suggestive of anything that grows in Italy. The ultramarine robe over which so many amateurs have become eloquent is said to be too glaring and dazzling for Correggio. Objections are also raised against the affected form of the fingers, the long nails, with all the light thrown on the edges, contrary to the Italian practice, and the minute creation of the foreground. The picture is said to have been painted by Correggio in the year 1533, but it was somehow unknown until the beginning of the eighteenth century. There seems to be no doubt that Correggio did paint a penitent *Magdalen*, but what became of it Signor Morelli has not been able to discover. The *Magdalen* in the Uffizi Gallery, he says, is no more Correggio's than the Dresden picture. The latter he believes to be "a copy which may have been executed towards the end of the seventeenth century by some Netherland artist not unconnected with Adrian van der Werff." Signor Morelli is a great admirer of Correggio, and the following passage (for which the author apologises as savouring of professorial style) suggests some of the differences and resemblances between him and Michel Angelo:—

Michel Angelo was sprung from a patrician family of Florence, and had grown up in a rich and splendid, but politically distracted city, at a time when moral character was on the decline. With his lofty, proud, and independent nature, he soon became disgusted with the want of principle and the idle pleasure hunting of his contemporaries. This disposition of mind we find already expressed in his celebrated *David*; it increased with years and especially after the fall of the republic at Florence, and found its strongest expression in his well-known verses on the statue of *Night*. Ill at ease, he at an early age withdrew from the world to live entirely to his art. He was at bottom, like Correggio, of a simple and pure nature.

Antonio Allegri, on the contrary, was the son of a modest, peaceful burgher family, and beyond love of his art, his mind can scarcely have been touched by any deep or enduring passion. If Michel Angelo pursued his calling, a solitary amid the noise and bustle and passions of a world-city like Rome, Correggio spent his days a solitary in a small provincial town, among Benedictine monks. As Correggio was endowed by nature to utter "sweetness of soul," alike in sport and sorrow, in the intoxication of sensuous joy as in the rapture of divine love, Michel Angelo's heroic temper led him mainly to body forth earnestness, dignity, and strength, the noble pride of a free nature, the bitter scorn of all that is base, unprincipled, and vain—in a word, all the manly attributes and passions of the soul—in their strongest utterances. Out of his titanic figures, the emancipated mind of man, as if in full consciousness of its God-given strength, looks down with true Olympian pride on the broken chains that bound humanity. It is certainly remarkable that the chief representatives of these two moods of mind, Correggio and Michel Angelo, should have flourished at the same time. Michel Angelo's whole cast of mind belongs rather to the age of Dante, yet, as a phenomenon, and because he worked chiefly for popes, and in the two intellectual capitals of Italy as it then was, Rome and Florence, he had a far more direct and powerful influence on his contemporaries than Correggio. All minds that came into contact with his were subjugated by him, or attracted out of their natural orbits; and thus, through him, the decline of art became still more precipitate than it would have been without him. Correggio operated more indirectly through the Carracci, so that his unhappy imitators do not muster very strong till the seventeenth century.

Between the powerful individuality of Michel Angelo and of Correggio, the divine Raphael stands midway, as the most measured, most calm, most perfect of artists, the only one who in this respect was an equal of the Greeks. Happy the land that had such men to offer to the world!

The best example of Correggio at Dresden is, according to Signor Morelli, the *Madonna with St. Francis*, which is said to

possess as pronounced an individuality as the *David* of Michel Angelo. The *Notte* and other works have been so shamefully used and so painted over, the Signor marvels that anyone can go into raptures over the chiaro-oscuro they are supposed to display. He is no less sceptical about the Giorgiones in the Dresden Gallery. The *Jacob and Rachel* is said to be manifestly by Palma, some share being assigned to Bonifazio. The *Adoration of the Shepherds* is credited to Bonifazio the Younger. The allegorical picture is said to be a copy of an original Giorgione. On the other hand, Signor Morelli says that the Dresden Gallery does possess the *Sleeping Venus* by Giorgione, long supposed to have been lost, although the authorities are not aware of their treasure. "When I consider," says the Signor, "that the eyes of but very few connoisseurs have been attracted by the wondrous light that shines from this noblest of all Venuses in the world, even through the veil with which the restorer has covered it, a sore feeling comes over me, a deep discouragement, and I cannot help saying to myself, What avails our vaunted culture? What is the good of hundreds of books on æsthetics and art, of public lectures, of our yearly art exhibitions, if, in default of express directions, we can pass unmoved by one of the most glorious and perfect creations that art of all times has ever brought forth?" If the canvas were properly cleaned the picture would become, it is said, one of the most precious gems in the art, for Giorgione's type of goddess is more noble than Titian's, Correggio's, or any other painter. The picture, it may be remarked, has been ascribed to Titian. Messrs. Crowe & Cavalcaselle believe that it is a copy of his *Venus* at Darmstadt, while Signor Morelli says that the Darmstadt *Venus* "is nothing but a free, and more than free, copy of Giorgione's *Venus* at Dresden, and that by some feeble German artist of the eighteenth century." When his guides are so much at variance, what is a student to believe?

Signor Morelli examines all the Italian pictures in the three galleries of Munich, Dresden, and Berlin in this manner, and it must be said that when he is most opposed to stereotyped opinions, he never speaks rashly, and always makes out a good case in support of his own theory. Tourists to the German galleries will find his volume to be an invaluable companion. So many guide books are inspired by the cicerone spirit, and print statements without giving a thought to evidence, there is a relief in meeting with a book that suggests to us the advantage of thinking more of the execution of a picture than of the painter's name which has been inscribed on the frame.

## ART SCHOOLS, GALLERIES, AND MUSEUMS.

THE following is extracted from the report of the Commissioners on Technical Education just issued:—

The question of providing museums of art and industrial objects for provincial towns is still almost in its infancy in this country; and though Birmingham, Liverpool, Nottingham, and recently Manchester, have established promising art galleries, and in other large towns also some interesting collections exist, there is as yet no provision of this sort at all comparable with the amply furnished museums and galleries possessed by many provincial towns on the Continent, especially in France.

It cannot be disputed that to the influence of these collections, and to the direct bearing they have on art and industrial training, is due much of that abundance of art resource which is so advantageous to many French industries and manufactures. Though we can scarcely hope to obtain in our provincial towns within an early date such collections of rare pictures as have been acquired in some foreign towns through the influence of old traditions and special causes of distribution, much is possible for us, in the direction both of augmenting our present resources and of bringing them to bear with greater effect on our art manufactures, and in vastly increasing the artistic power of our skilled artisans.

In the case of France, which stands at the head of artistically-educated countries, the provincial museums have been largely assisted by the State, both by money and by contributions of pictures and other objects. The surplus stores of the Louvre are freely given to such galleries, and the supply of good copies and casts for the art schools is administered with a lavish hand. It would, however, be erroneous to suppose that foreign provincial galleries lean entirely on the support of the central Government. The magnificent gifts and bequests of private individuals to the galleries of Limoges, Montpellier, Dijon, Nancy, Lille, and other towns, bear witness to the fact that local effort and enterprise are by no means exclusively British virtues, and they prove also the high value which the presence of a local gallery has in stimulating the taste and attracting the munificence of the inhabitants.

At Limoges the splendid collection of enamels and pottery, nearly all due to private gifts, has a direct and most valuable bearing on the local porcelain industry. The art school is under the same roof as the museum, and at this school some 1,200 students, chiefly of the artisan class, receive gratuitously a sound technical instruction, not only in the principles of decorative art, but also in the direct and practical application of art to the chief manufactures of the town. The same may be said in some degree

of Tours, where the museum and picture gallery are in direct connection with the art school, and the teaching is adjusted to help skilled industry as well as to give a pure art training. The public art schools of Lyons also, while holding a high position as centres of pure art teaching, do very much to serve the local designing; and the collection of artistic fabrics, and of drawings and designs connected with the silk trade, forcibly illustrates the value of local effort and management in advancing the interest of special artistic industries. The porcelain painting of Nantes and the glass painting of Angers owe very much to the direct teaching of their art schools, and to the admirable illustrative collections they possess.

It may be broadly asserted that every French provincial capital possesses not only an efficient school of art, but a picture gallery and museum, either of industrial or antiquarian interest, and also a good library. Nor is it found that these influences tend mainly to the creation of picture-painters. That department of art is not specially encouraged, the main function and utility of their art-teaching being in its application to local trades and industries. As the State joins with the local municipal body both in providing the budget and in supplying the art collections for provincial galleries and art schools in France, so the control and management of these institutions are of the same joint character. The State appoints certain leading officials and directors, while all matters of detail are conducted generally by the mayor and a small committee of management. It seems a very useful and even high view of the duties of a municipality that its resources and influence should be thus applied to the advancement of art; and so much is this obligation recognised in France that the museum and gallery are now well-established provincial institutions. Some are of high value; others, perhaps, are of less worth, but all tend to an elevation of taste and industrial skill. Special notice is due to the abundance and excellence of the casts and models in nearly all the French art schools and academies. These are freely and gratuitously supplied by the State, and no request for them is ever refused by the central authorities. The prominence given to modelling in all the French State-supported schools is a feature of marked value, and contrasts forcibly with the meagre attention bestowed on that essential branch of art teaching in our own schools. Though the provincial art training of France is mainly directed to industrial ends, very ample provision is made in all the chief schools for the transference of promising pupils to complete their studies at the *Ecole des Beaux-Arts* in Paris, at the public expense.

In many of the principal towns of Germany we found also excellent and well-arranged art museums, some of them occupying the same buildings as the schools of art. This was the case at Berlin, where, chiefly owing to the efforts of the Crown Princess of Germany, an admirable museum of works of art has been brought together, on the model of the Museum at South Kensington, its avowed prototype. This museum contains fine collections of pottery, porcelain, enamels, metal-works, textiles, wood carvings, and decorative art workmanship. It has been arranged with special reference to the use of the art students, but it is freely opened to the public for study and recreation.

At Vienna there is likewise a close and intimate connection between the school and the museum, and the admirable collections of ornamental art have been largely acquired with the view of aiding and supplementing the teaching of the professors in the art schools, which are conducted in the same building. The Museum of Industrial Art at Dresden is a model of the manner in which collections of art-objects may serve to illustrate and bear upon the instruction given in the schools. The collections occupy the ground floor of the building formerly occupied by the Polytechnic School, and the art school is carried on in the rooms above. Under the able direction of Professor Graff, the students make large use of the fine collections of textile fabrics, majolica, glass, furniture, and metal work; and in a special room in the museum has been brought together a most interesting display of modern furniture, leather work, glass, porcelain, metal work, textiles, and almost every description of art manufactures, by workers in Dresden and its vicinity, from designs by the students and masters of the school. This latter feature is one we did not notice elsewhere, but which appears to us to be well worthy of imitation. We should specially notice the library at this museum, which contains many thousands of designs for art workmanship, mounted on cards and arranged in boxes for facility of reference, each box consisting of some sixty or seventy sheets of designs for some special object, thus "chalices," "lace," "bookcovers," &c. This section of the library alone contains above 27,000 sheets of designs.

At the admirable Industrial Art Museum at Nuremberg, this plan of arranging designs was, we believe, originated. The collections at Nuremberg, though on a smaller scale than those at the more important towns we have already named, are very complete and are extremely well chosen. Some art teaching is carried on at this museum, though a completely equipped art school does not form part of the scheme. There is a class of bronze-workers and electrotypers, and excellent practical work is done. Copies are produced of the art objects in the museum, for distribution to other parts of Bavaria, and some desirable exchanges have been

made with other museums. As these foreign museums become more numerous, some larger and more extended system of international exchanges with England and the Continent than that already in operation may be introduced with advantage. The Museum of Industrial Art Workmanship at Munich is probably the most extensive on the Continent. The collection of textiles is very important, and though no school is, we believe, attached to the Royal Museum, every facility is given to art students to make large and free use of the collections. At Zurich, the Commissioners found at the Industrial Art School an excellent museum of ornamental art, collected for purposes of study. This museum has only been established for a few years, but it is already rich in metal-work and wood-carving.

In some of the smaller German towns, permanent collections of art workmanship are brought together in the Gewerbe Hallen, or Trade Halls. These are very frequent in Baden and Wurtemberg. Together with the best examples of modern artistic work, we found displays of art reproductions, collections of textiles, and frequently special retrospective collections relating to the chief industry of the district. In the Central Stelle at Stuttgart is an excellent museum somewhat of this character, and in numerous small towns of the Black Forest we found flourishing museums, largely aided by grants and loans from the Government collections at Carlsruhe.

It is certain that no Continental country can boast of such an admirable system of loan collections as that supplied by the Science and Art Department at South Kensington, and it would be well if even this supply, large as it now is, could be still further increased, and the collections allowed to remain for longer periods in the towns to which they are sent. As an example of what may under existing conditions be achieved in this country by means of local effort, we cannot do better than point to the splendid art gallery and museum at Liverpool, which is almost entirely due to the munificence of local benefactors. The building for the Derby Museum of Natural History, the bequest of the Earl of Derby, valued at 50,000*l.*, was erected by Sir W. Brown at a cost of 40,000*l.*, and the museum has been further enriched by the unique collection of historical art presented by Mr. Joseph Mayer, F.S.A. We are informed that the museum is visited by manufacturers and artisans from the Staffordshire Potteries, for the sake of the valuable collection of ceramic ware which it contains. Subsequently Sir A. B. Walker erected and presented the magnificent art gallery at a cost of nearly 40,000*l.* In the same group of buildings are the Free Library and the Lecture Hall. The cost of the entire block has been little short of a quarter of a million sterling.

The public Art Gallery of Manchester has quite recently been established under the powers of the Manchester Corporation Act, 1882, by which the Corporation became possessed of an old foundation, the Royal Manchester Institution, in the building of which the Art Gallery is now accommodated. The well-known "Book" collection of ancient textiles has been purchased by the Corporation as the commencement of an Industrial Art Museum, especially of service to designers engaged in the staple trades of the district. We are glad to observe that the Art Gallery and Industrial Museum are open on Sundays during the winter, between the hours of two and nine p.m., free to the public, and we learn that they have been visited by crowds of artizans and their families; the number of visitors on the four Sunday afternoons ending January 6, 1884, having been 10,308. Their conduct was without exception exemplary, great interest being shown by the visitors in the different works on view, particularly when the subject was thoroughly explained to them. Nor must we forget to mention in this connection the conversion of the castle at Nottingham into a public Museum and Art Gallery, likewise supported by the Corporation of that town, as well as the valuable Industrial Museum at Edinburgh, connected with the Science and Art Department.

Short of a complete reorganisation of the principles on which our national art institutions are administered, it would be difficult to suggest a plan by which the right of large provincial centres of industry to share the advantages of the national art treasures and Imperial support could be fully and practically recognised; but, even under our present disjointed administration, deficient, as it is, in Parliamentary responsibility, some more liberal provision might be made, both in money grants and in the permanent gift of surplus objects and reproductions, for the endowment of provincial museums and galleries. Such gifts, and the general character of the collections themselves, should have special relation to the trades and industries of the various localities; and an intimate connection should be established between the metropolis and provincial towns in all art matters.

The small degree in which our art schools, with few exceptions, are now contributing either to industrial or designing art, is only too well known, and a marked change in this respect is essential before our schools can hope to take rank with those of the Continent in direct commercial utility. And to this aim no more valuable accessory can be provided than that of museums well supplied with examples bearing on the trade or industry of the town or district, and placed, if possible, in the same building with, or in close proximity to, the school of art.

Municipal and other local authorities, as well as the ratepayers at large, should be induced by every means to acknowledge and

discharge the responsibilities they are under to the community in this respect; and by the expansion of their powers under the Free Libraries Act they should be enabled to make ample provision for the endowment, maintenance, and management of museums and galleries, fitted not only to supply the means of higher artistic study and elevating recreation, but to serve directly in the improvement and development of existing industries, and in the acquisition of new branches of trade and employment for the skilled workmen of our country.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

THE last of the bi-weekly excursions of the members of this Association took place on Saturday. The conductor was Mr. Hippolyte J. Blanc, architect. The Forth Bridge works, Queensferry Friary, Barnbougle Castle, Dalmeny House, and Dalmeny Church were visited. Mr. Blanc stated that the Friary at Queensferry was built and endowed by Sir George Dundas of Dundas as early as 1332. It was built for Carmelite Friars, and dedicated to the Virgin Mary. All that now remains is a square tower with an eastern and southern wing. Used partly as an oil-store, regret was expressed at finding the place so neglected. At Barnbougle Castle Mr. Blanc explained that this ancient stronghold, built in 1414, was at one time the baronial mansion of the once powerful, but long extinct, family of the Moubrays. It passed into the possession of the Primrose family in 1662. To the present proprietor, the fifth Earl of Rosebery, they were indebted for the reconstruction of this interest landmark. Planted on a rock-built terrace, with a quaint stone railing surrounding it, the castle was in no wise remarkable except for its fanciful situation. The present edifice has been reared upon the original foundations. Dalmeny House, the seat of the Earl of Rosebery, was erected about the beginning of the present century by Archibald John Primrose, fourth Earl of Rosebery, and, designed by Mr. Wm. Wilkins, it expresses a phase of the English Perpendicular style as practised in England during the fifteenth century. A pleasant walk of half an hour brought the party to Dalmeny Church, which, it was mentioned, at one time belonged to the Abbey of Jedburgh. It is a singularly entire example of early work, and is to be regarded, said Mr. Blanc, as a peculiarly interesting example of a class of churches which, though comparatively numerous in the south-eastern districts of Scotland, are rarely met with but in a ruinous state. The whole details point to the Norman period. For richness of detail and completeness Dalmeny and Leuchars are peculiar, and of the former Hill Burton says it is one of the most truly venerable and interesting specimens of ecclesiastical architecture of which Scotland can boast.

## SOUTH KENSINGTON MUSEUM.

UNDER the designation of "The George Cruikshank Collection," the South Kensington Museum is about to receive an unrivalled series of the artist's works, ranging over a period of about seventy years. Selected copies, for the most part with the autograph signature of their author, of the engravings, etchings, and coloured caricatures by which the artist made himself known wherever English is spoken, during seventy years of industry, have been reserved or gathered for the purpose of this gift; and to the series have been added some of the most elaborate and interesting of the original water-colour drawings from which his etchings were executed. His widow, desiring that these works should form a lasting memorial of her husband, is about to present the whole collection, numbering upwards of three thousand works, to the South Kensington Museum. The museum is also about to receive an important addition to its collection of English porcelain, pottery, and Battersea enamels. Lady Charlotte Schreiber has presented to the museum the valuable series of specimens, amounting to some thousands, which she and the late Mr. Charles Schreiber had brought together after many years of careful and laborious collection in all parts of England and the Continent. All the best varieties of English china are represented in the collection; Bristol porcelain especially is better illustrated than ever before. Chelsea, Bow, Worcester, Derby, &c., are represented by rare and choice examples. The collection also contains numerous examples of such special and interesting developments of English pottery as the curious white salt glazed ware. To these Lady Schreiber has added her complete and curious collection of Battersea enamels, together with rare specimens of old English glass.

The Storm Overflow Sewer just completed at Deptford is the largest that has been constructed in the metropolis, and has taken about eighteen months to construct. It is 11 feet in height and 13½ feet in breadth. The entire sewer is laid in a bed of concrete, and is at its minimum thickness 1 foot 4½ inches. The total cost has been 34,000*l.*, and the ground covered is 3,350 feet.

## NOTES AND COMMENTS.

SIR EDMUND BECKETT has resigned his connection as Honorary Associate with the Royal Institute of British Architects, in a letter to the Secretary, in which he declares that the primary object of the Institute has become to advance, not architecture, but architects. The Council, in acknowledging the letter, express regret that Sir EDMUND "should so inadequately appreciate the aims and actions of the Institute." There are not a few who will congratulate the Institute upon the retirement of a gentleman who ought never to have been elected. No doubt it was thought that the reception in a friendly way of so pronounced an opponent would have the effect of making him something like a friend; but there were those at the time who shrewdly doubted the success of a policy so feeble and insincere. Sir EDMUND BECKETT has too long and too inveterately identified himself with the strange doctrine that architects are useless, to allow any chance of his becoming a supporter of their professional cause. When he now speaks as he does of "architecture not architects," we can only ask what practical meaning is to be attached to his words; in common parlance they have none, unless it be to suggest the obvious absurdity that architecture ought to be administered, not by those who understand it, but by those who do not. If he were to say *not architecture but surveyors*, we might have a word to say upon the subject.

THE Council of the Society of Arts desire to bring under the notice of English manufacturers the Exhibition of Art Industries which is being organised by the Central Union of Decorative Arts, Paris. This exhibition is the third of a series of technological exhibitions of art industries formed by the Union. That of 1880 was specially devoted to metal industries; that of 1882 to the industries connected with wood (furniture), textile fabrics, and paper. The forthcoming exhibition will be devoted to stone, wood (building), ceramics, and glass, and will be held in the Palais de l'Industrie, in the Champs Elysées, Paris, from August 1 to November 21, 1884. It will comprise a modern exhibition and a retrospective museum. The heads of the classification to be adopted in the exhibition are as follows:—Group I. Stone (section 1, natural stone; section 2, artificial stone; section 3, precious stones and gems; section 4, designs and models). Group II. Wood (section 1, natural woods; section 2, decoration and imitation of wood, lacquer, varnishes, &c.; section 3, designs and models). Group III. Pottery and glass (section 1, ceramics; section 2, glass; section 3, enamels; section 4, mosaics; section 5, designs and models; section 6, application of photography to decoration).

THE sixteenth annual report of the Surveyors' Institution has just been made by the Council, and the Council may be congratulated on the very satisfactory account of the state of the Society, and the work it has effected. The number of members is at present much larger than in any previous year, the total number, including students, being now 1,131. Since the introduction of examinations the student class has received a large increase of members. During the year, 87 candidates offered themselves in the various divisions—51 at the preliminary examination in January, and 36 at the professional examinations in April last. Of the former 30 earned a pass, and of the latter 23 are reported as passed. Much of the work of the candidates reached a satisfactory level of excellence. The work in the building section fell, as a whole, considerably short of the standard which it should reach, and in this section the largest percentage of failures occurred. Candidates in the building section are advised for the future to devote more attention to the principles of construction, and to the study of strains in iron and timber. In field work the levelling was in a few cases extremely good. The practical timber measuring and the forestry paper were remarkably well done by a large majority of the candidates, but the highest merit was perhaps reached in the subject of sanitary science.

AN exhibition is now open at the Tuileries which is worth a visit from architects, builders, and members of the City guilds, if any are in Paris. It consists entirely of drawings and models which have been made by carpenters' apprentices. France seems to be destined to fulfil the office of devising experiments in government and political economy for the benefit

of other nations, and this exhibition is part of an experiment in technical education undertaken by a society of working carpenters. The drawings may not be attractive to ordinary visitors to picture galleries, but there can be no question as to their importance. They show that a workman's society insists on students being well grounded in their knowledge of form and of details of construction. Problems in descriptive geometry are carefully worked out, and the applications of the science are shown in many varieties of winding staircases, groins, roofs, and domes. The drawings are not like those which a lithographer or a draughtsman could produce, and apparently the aim of the masters has been to secure that the pupils should understand all possible appearances of the thing represented, and therefore no thought has been given to artistic effect. The models are neatly made, and the exhibition is creditable to students and society. Another advantage in the exhibition is that an intelligent carpenter is always present to represent the society and to give information.

INDUSTRIAL art comes nearest to perfection when the human figure becomes an element in it; but to apply the figure properly is so difficult, it is not surprising that so many modes of decoration have been invented in which something else has been substituted. A work is now being published by MM. GOUPIL which is likely to do service to art by suggesting what can be done when the figure is made the principal element in decoration. M. CARRIER-BELLEUSE, the sculptor, who is the director of the Art Department at Sèvres, is the author of the work, which is entitled "*Application de la Figure humaine à la décoration et à l'ornementation industrielles*." It will consist of ten parts, containing about two hundred plates. All the plates are ready, and four of the parts have been issued. It is needless to say that M. CARRIER-BELLEUSE is the first authority in France on the subject of industrial art, and it cannot be forgotten that he was one of the pioneers in the English art revival, as about thirty years ago he was the art director at Messrs. MINTONS', and the late Sir HENRY COLE was indebted to him for advice when the Government art schools were established. M. CARRIER-BELLEUSE's figures are admirably suited for decoration. He avoids the massiveness and contortions which at one time were supposed to constitute high art. His figures are marked by grace, vivacity, and beauty of contour. The goddesses are light enough to rival CAMILLA in walking on grass without bending the blades. No less remarkable is the appropriateness of the figures to their position; and the plates form a collection of compositions of very great beauty. An effort should be made to secure the originals for England, and especially for some town in the Potteries. If they were added to the Wedgwood Institute it would be difficult to put a limit to their influence on English art.

ANOTHER English collection is to be sent to Paris for sale. In a week or two Lord DUNMORE's pictures will be sold in the Hôtel Drouot. They comprise works by RUBENS, PAUL POTTER, REMBRANDT, &c.

A FINE Arts and Industrial Exhibition, which was opened yesterday in Wolverhampton, has been got up in aid of funds to provide works of art for a handsome art gallery just presented to the town by an anonymous donor, at a cost of some 5,000*l*. The show of pictures in the gallery is probably one of the finest provincial displays collected together, and they have been lent from public and private collections all over the country. Approximately there are 800 pictures in the exhibition, and of these about 150 are water-colours. Many of the latter are very large, and choice works of TURNER, COX, DE WINT, NASH, MÜLLER, JAMES HOLLAND, and SYDNEY COOPER are included in the collection. Among the oils will be found splendid examples of RUBENS, SNYDER, LAWRENCE, J. B. PAYNE, CRESSWICK, J. WILSON, POYNTER, BONINGTON, FRIPP, AUMONIER, W. COLLINS, Sir JOHN GILBERT, H. DAWSON, LEADER, E. LONG, LASLETT, BIRD, and many other famous painters. RUBENS's charming picture, *The Holy City*, has been lent by Lord BRADFORD, and the Earl of WARWICK has contributed a magnificent VAN DYKE, *Gondomar, the Spanish Ambassador*, and another celebrated picture by RUBENS of his own daughter. The Earl of DARTMOUTH and the Earl of DUDLEY have sent several splendid SNYDERS.

The Architect, May 31<sup>st</sup> 1884.

NEW MUSEUMS AND SCHOOL OF ART, CHESTER.

THE view in this week's issue (taken from the original drawing in the Royal Academy) illustrates a building intended to accommodate the scientific societies of Chester, together with the Schools of Science and Art, with a view to centralise the various collections of antiquities, natural history specimens, and science subjects.

The joint committee have secured a very good site on the Grosvenor Road, the main entrance to the city from the Welsh side, partly by purchase, but chiefly by the gift of His Grace the Duke of WESTMINSTER, who has evinced the greatest interest in the undertaking from its commencement, heading the subscription list with a donation of 4,000*l*.

The accommodation has been distributed with the greatest care to suit the varied societies, each having separate floors allotted for their purpose. The ground floor is chiefly occupied by a large lecture-hall, available for all the societies in common; an archaeological museum, 60 feet by 30 feet; and an art gallery, 60 feet by 23 feet, with top light, suitable for a permanent picture gallery, and available for conversaziones; the remaining portion, principally committee-rooms and library, being occupied by the Archaeological Society.

From the entrance vestibule is a large staircase hall leading to the first floor, which is intended for the Science and Natural History Society, founded by the late CHARLES KINGSLEY, when Canon of Chester. The front portion of building contains class-rooms and library, whilst an ample laboratory is provided in the rear, together with a museum exactly similar to the one already mentioned, besides a smaller one adjoining.

The second floor contains a suite of rooms for the School of Art, consisting of male and female elementary rooms, modelling, antique, and painting-rooms, all of which are planned to obtain light and accommodation best suited to their purpose.

There are the usual retiring-rooms and lavatories; the basement contains ample storing space for packages and heavier specimens, and a keeper's house is planned at the east corner of the building.

It is intended that the floors be of fireproof construction, and the building warmed and ventilated by special systems of pipes. The external facing will be of terra-cotta and bricks, with tiled roofs, and the style adopted is considered suitable to the surrounding buildings, which are more Classic in character than the older portion of the city.

The plans have been prepared by Mr. THOS. M. LOCKWOOD, architect, of Chester, and the work will shortly be commenced, the subscription list at present amounting to 6,500*l*.

INTARSIA DOOR, DUCAL PALACE, URBINO.

THE illustration, like one lately published, has been taken from drawings by Mr. HAYES, an artist who was fortunate in carrying off one of the principal prizes given by the City Companies. Mr. HAYES resigned an appointment he held in order to devote himself to the study of decorative art in Italy, and he has brought back a most valuable collection of details, of which the plates published may be taken as samples.

ST. JOSEPH'S CHURCH, WATH-UPON-DEARNE, YORKSHIRE.

THIS church was completed and solemnly dedicated by the Bishop of LEEDS about four years ago. It was erected at the cost of Mrs. CADMAN, of Cross House, and Mr. and Mrs. BECKETT NICHOLSON, all of Wath-upon-Dearne, and stands on a picturesque site adjoining the high road from Wath to Mexbro. The presbytery is placed on the south side, with a direct communication from the church and sacristies. Externally the buildings are local stone, neatly hammer-dressed, and the roofs covered with Broseley tiles. The design has been carefully studied from the local work of the district, in which late fifteenth-century work of the rectilinear period abounds. A stone *fliche* marks the division between nave and chancel, and rises to a height of 70 feet, and contains two fine toned bells cast by Messrs. LEWIS & Co., of Brixton. An entrance porch, with niche and figure of the patron saint, leads into the nave, 61 feet by 24 feet, and the chancel 28 feet long, with the organ chamber placed on the north side, and oak benches or choir stalls. The east, west, and other windows are filled with fine series of glass by

MESSRS. LAVERS, WESTLAKE & Co. The eastern window has the Crucifixion, with figures of the Blessed Virgin and St. John, and patron saints. The gas standards were supplied by Messrs. HARDMAN & Co., of Birmingham, and the warming is on Haden's principle. The font, of carved stone with an oak spire, is placed at the south-west corner, and the church is seated with benches of pitch pine. Messrs. HADFIELD & SON, of Sheffield, were the architects.

BLOCHAIRN FREE CHURCH, GLASGOW.

## THE ARTISTS' BENEVOLENT INSTITUTION.

LORD WOLSELEY presided on Saturday at the annual dinner of the Artists' General Benevolent Institution, held at Willis's Rooms. Supporting the chairman were Lord Crewe, Sir Frederick Leighton, P.R.A.; Colonel King-Harman, M.P.; Mr. Carbutt, M.P.; Mr. Pender, M.P.; Mr. J. Frith, R.A.; Sir John Gilbert, R.A.; Mr. J. E. Millais, R.A.; Lieutenant-Colonel Edis, Colonel of the Artists' Volunteer Corps; Mr. F. Holl, R.A.; Mr. Colin Hunter, R.A., and a large number of artists. After the usual loyal toasts, the Chairman, in proposing "Prosperity to the Artists' General Benevolent Fund," referred to the increasing number of those who adopted art as a profession, tempted by the high prizes which fell alone to the few men of unusual ability. Beyond these were others who were comparatively successful in the race of competition, but behind all were hidden artists out of sight and almost out of mind, whose prosperity had been clouded by accident or disease, some dead, leaving widows and orphans unprovided for. By such men and their families severe suffering was sustained, suffering often enhanced by a spirit of independence and a delicacy of feeling which made them unwilling to make their condition known. It was the special purpose of the Institution to mitigate such suffering without making known the names of the recipients. During 1883 the sum of 3,961*l*. was expended in 169 applications of this kind, the working expenses of the year amounting to 325*l*. 10*s*. 8*d*. From the foundation of the Institution in 1814, sums, amounting in the aggregate to 68,503*l*., had been granted in relieving 4,158 cases. Much as had been done by the Institution in the past, it was to be feared that its sphere of operations would have to be extended in the future, on account of that growing disposition to adopt art as a profession in many cases by persons who had no natural qualifications. Affiliated to the Institution was an offshoot for the orphans of artists and for the benefit of their widows. Its funds were kept entirely distinct from those of the Institution, and it well deserved the attention of those who had the means to contribute to charities. In this case as in that of the Institution there was the most careful economy in expenditure, the honorary secretary, Mr. J. E. Millais, R.A., and the treasurer, Mr. P. C. Hardwick, sacrificing their time and labour personally to the work. He was sure of the sympathy of that assembly in expressing a hope that as years rolled on so excellent an institution would go on flourishing, and make itself still more worthy of the noble profession by whom it had been created, and for whose interest it existed.

The Chairman, in giving the next toast, that of "The Royal Academy," coupled with the name of the president, referring to the severe criticisms to which the Academy was subjected, said he had come to the conclusion that it was in the same position as his own profession in being assailed by men whose keenness of criticism was in exact proportion to their ignorance of the subject. At any rate, he thought he was expressing outside opinion in saying that so long as the Royal Academy covered their walls with such magnificent works of art as were now on exhibition they would retain the confidence of the nation.

Sir Frederick Leighton said the toast which Lord Wolseley had just proposed in such kindly terms was always sure of a cordial reception at that table, because they knew that the Royal Academy, in the persons of its members, took the deepest interest, and participated in the high and noble work which the noble Lord had by his presence come to support. No bonds were more stable than those which were knit by common concert to worthy ends in a good cause. Those bonds would never be loosened on the side of the Royal Academy, and he was not the less certain that the representative of the Royal Academy would at all times receive that kindness for which, not for the first time, he had now to tender his warmest thanks. A privilege attached to the duty he had just discharged, that was to invite them to join in a hearty and cordial expression and recognition of good fellowship in regard to those numerous other societies in the metropolis which existed, as the Royal Academy existed, solely for Art's sake. He should not count them up; they were numerous and growing in numbers, but while they increased the scope of their efficiency they would not outgrow their sympathy. In the course of the proceedings the treasurer, Mr. P. C. Hardwick, announced that the sum of 1,376*l*. had been subscribed that evening.

## FOREIGN IDEAS ON ART INSTRUCTION.

THE following is taken from the second report of the Royal Commissioners on Technical Instruction, which will be interesting as showing certain opinions held abroad in regard of art teaching on the Continent. The Commissioners say:—Whilst on the Continent, we heard many flattering opinions as to the vast importance of certain technical and art schools that we visited. We also received opinions and evidence of a more critical character, which we have no desire to ignore. One gentleman, of large experience and knowledge, warned the Commissioners against recommending the too extensive establishment of high art schools on the Continental model. Referring to the Antwerp Academy of Fine Arts, with which he was very familiar, he said that much greater care should be exercised in England than at Antwerp as to the admission of students. It is quite a mistake to open the door to all who wish to enter, when no charge is made for the teaching. These academies are excellent institutions if kept to their right use; they bring deserving and talented students to the surface, and benefit the State as well as the students; but a very careful discrimination should be exercised over the admission of students, or the public funds may be wasted upon incompetent and unworthy recipients. Every sentimental youth believes himself to be a born artist, or, what is quite as bad, his father and mother think him so, and, seeing the success of some really talented student, they fondly hope for and expect the same from their son, and they send him to an Academy to become a painter. Why should they not send him? The tuition costs nothing, and it sounds well to be able to speak of a son who is studying at the Academy, and it is flattering to hear the high praise of neighbours who are called in to see and admire the drawings he has sent home. The youth severely drains the slender resources of his parents while for three or four years he goes through the courses at the Academy, and encounters the more serious temptations which all large towns offer to young men who are removed from parental control and influence. The young man may be destitute of talent, or lacking in the equally important quality of perseverance, and returns to his home expecting the world to bow at his feet, and give him his own price for the third-rate productions which he has to sell. The self-styled artist, conceited from the beginning, naturally becomes discontented, and may afterwards be found (as our friend has found many) with his coat out at elbows, unable to earn a living; a wretched professional artist, without imagination or designing faculty, pushing indifferent pictures upon an overstocked market. When a peasant's son paints *Andromeda Chained to the Rock*, or *Ajax Defying the Lightning*, he often assumes airs altogether incompatible with his position or his possibilities. Very few of these free students ever become artists of merit, still fewer really good industrial designers, but they often get into an extravagant way of living, without possessing the means to justify such habits, and they grow up into a class of men of far less use to the world than if they had remained hewers of wood and drawers of water in their own villages. Above all, avoid encouraging the idea that it is the schools which make the artists, designers, and engineers, and that, given the schools, great artists will spread themselves over the land. There can be no greater mistake. Belgium and Holland produced their best artists without schools, Holland its best engineers without schools, and what schools did the great inventors of England attend? The work of life puts into the shade the teaching of the professors. If you are too liberal in opening the highest schools to the public, without such safeguard as a proper entrance examination, you draw mediocrity into them, and run a great risk of wasting your teaching on students who, whatever other qualities they possess, were never intended for artists. The free art schools are a constant temptation to the stripling, whose great ambition is to become a "Monsieur" without working for the title; he goes there and fails to produce anything that anybody will buy. There is no happiness for such a man; he had better have remained a house-painter at home. In studying Continental art schools, it is desirable to reckon up their cost and compare it with the results. Education has to be paid for by somebody, and in those cases in which the payment is made entirely by the public, there should be a reasonable assurance that the public will be benefited. The great art schools of France and Belgium are admirable institutions, but, as examples for England, they present features to be avoided as well as to be imitated.

One gentleman remarked that, from his large experience of foreign nations, he had come to the conclusion that race and blood have great influence upon the handicrafts of a nation. The French are more elegant than the English, altogether apart from education. Their climate is milder and more sunny, gaiety is natural to them, and, living much more in the open air than the English, their natural tastes are more susceptible of development. The French designs are characterised by greater elegance. In Paris the designers are surrounded by examples and aids to inspiration such as cannot be found elsewhere. Paris, to use a commercial term, may be called "the exchange" for designers from all parts of Europe, and it is the principal market for designs. The draw-

ing of the Parisians is generally of a decorative character, and in freedom of outline they excel all other countries.

On the fancy textiles of England and France, and the aptitude of French workmen, the following is the substance of opinions expressed. The productions of Lyons are now universally acknowledged to be in advance of those of Coventry and the other silk manufacturing towns of England. The workman of Lyons, who, as a matter of fact, lives in the same attic with his loom, is always making patterns. He spends his days from childhood to old age over patterns, and the last pattern in the loom is the household topic till the web is woven. As the loom is seldom allowed to be idle, both the wife and children are taught to weave each new pattern as it comes. While the husband eats his dinner the wife takes her turn at the loom, and the children take their turns also while the father takes his rest and the mother goes about her domestic employment. So all day long the busy shuttle is kept going, and patterns and designs are ever before the physical and mental vision of the Lyons weaver. The day may come when England will overtake Lyons; but how can she hope, by the establishment of a few schools, to equal what natural qualities and constant training have done for the Frenchman? It is in the opinion of our informant no more reasonable to expect the English to surpass the French in artistic work, in designing and decorative operations, than it would be to expect the French to equal the English in mechanical ingenuity and in the great engineering operations which have so largely contributed to the industrial supremacy of England.

## THE INSTITUTION OF CIVIL ENGINEERS.

AT the last ordinary meeting of the session, held on Tuesday, Sir J. W. Bazalgette, C.B., president, in the chair, a paper read was on "Wood Pavement in the Metropolis," by Mr. George H. Stayton. The author directed attention to the nature and extent of the various wood pavements in the metropolis, and to a comparison of the results obtained. The aggregate length of the streets of London was 1,966 miles, of which, excluding 248 miles in course of formation, 1,718 miles were thus maintained by various authorities, namely:—Macadam, 573 miles; granite, 280 miles; wood, 53 miles; asphalt, 13½ miles; flints or gravel, 798½ miles.

The existing area of wood pavement was 980,533 square yards, and its estimated cost 600,000*l*. Not more than 4·38 per cent. was east of the city or south of the Thames. The method of construction adopted by the author was described and illustrated. His practice was to set out the levels of the channels so as to allow a rise to the crown of the road equivalent to 1 in 36 above the mean channel-level. The inclinations of the channels should not exceed 1 in 150, and numerous street gulleys should be provided. An extra cost of 4 per cent. for gulleys was money well spent. The foundation of the Chelsea pavements consisted of a bed of concrete 6 inches deep, composed of 5½ parts of Thames ballast to 1 part of Portland cement; the entire cost for materials and labour when completed was 2*s*. 3½*d*. per square yard. The use of old broken granite as a substitute for Thames ballast, although cheaper, was not recommended. Concrete made from that material was less homogeneous than pure ballast concrete.

The greater part of the wood pavement in London was composed of rectangular blocks of yellow deal. Before adopting wood pavement the author inspected the various kinds of pavement then laid, and came to the conclusion that a plain but substantial system was the best. The blocks were 3 inches by 9 inches by 6 inches, and were specified to be cut from close and evenly-grained, well-seasoned, and thoroughly bright and sound Swedish yellow deals (Gothenburg thirds). The author knew of no more suitable wood in the market, which so satisfactorily stood the wear of traffic and atmospheric changes. Of hard woods, pitch pine took a high place in point of wear, the ascertained annual vertical wear of the section in King's Road during four and a half years being 0·055 inch only. Neither elm nor oak blocks would withstand the atmospheric changes to which street surfaces were exposed; larch would probably take a high position, but the available supply was limited. In many pavements the blocks had been dipped in a creosote mixture; in a few instances they had been creosoted or mineralised, but at least one-third had been laid in their natural condition. The ordinary dipping process was of little value as a preservative, but might be utilised as an external discolouration for inferior blocks. The author had tried creosoted blocks, but experience had convinced him that they were not more durable than plain, that their surface was less clean, that the system was 20 per cent. more costly, and that it tended to produce premature internal decay. The wood pavement in Chelsea required 41 half blocks per square yard; they were laid upon the concrete in their natural state, with the fibres vertical, and with intervening spaces three-eighths of an inch wide. The joints were filled with cement grout, composed of three parts of Thames sand to one part of Portland cement; they were kept parallel by means of three cast-iron studs fixed in each block, which rendered the pavement firm and steady until the grout was thoroughly set. A top dressing of fine gritty material completed the work. If practicable, traffic

should be excluded from a newly-laid pavement for at least one week after completion. The result of five years' wear convinced the author that the plain system comprised all the essentials of a sound pavement; that it provided a quiet and smooth surface for vehicles, and safe foothold for horses; that the cement joint adhered to the wood, effectually resisted wet, did not unduly wear below the wood surface, and thereby allow dirt to accumulate in the joints; neither did it displace the blocks. The net cost was 10s. 6d. per square yard, and but comparatively slight repairs had been found necessary. The blocks were originally 5'87 inches deep, but their present average depth was 5'22 inches in King's Road and 5'60 inches in Sloane Street, their probable life being seven and eight years respectively. Particulars of wood pavements in various parts of London were also given at considerable length; and in those instances where the approximate weight of the traffic per yard width was known, the details of cost, maintenance, durability, ascertained vertical wear of wood, &c., were described.

### ROMAN ALTAR AT GENEVA.

OPERATIONS were last winter begun in the bed of the Rhone, at Geneva, in connection with a scheme for utilising the power of the stream for mechanical purposes. During the work a part of the river bed, near the island on which stands Julius Cæsar's Tower, was laid bare, and owing to the antiquity of Geneva, and the fact that it was an Allobrogean town before it became a Roman station, hopes were entertained of making important archæologic finds, and lately there was found, buried in gravel among a range of piles, relics of the Lacustrine age, a block of white Jurassic rock, which has been evidently dressed by the hand of man, and having in the centre a circular depression surrounded by a sort of crown. Further examination showed it to be the upper part of a Roman altar. It is in the ordinary form of a pilaster, with capitals, and a corresponding base terminating in a crown, in relief, cut in the stone. The height of the relic is 80 centimètres, the width 33. There is no other trace of ornamentation than the mouldings and cornices of the upper and lower parts, but on the principal face there appears an inscription, in superb letters, and an admirable state of preservation. It runs thus:—*DEO NEPTVN C. VITALINIV VICTORINVS MILES LEGI. XXII. ACVRIS V. S. L. M.* Only two letters are lacking. At the end of the second word the engraver had not room for the final O, and at the end of the fourth word an S has been effaced by time, or worn away by water. The word *legionis* has been shortened into *LEGI*, but the truncation of the I may be due to an accidental erasure. The inscription, which is easily read, is to the following effect:—*Deo Neptuno C. Vitalinius Victorinus, miles legionis XXII., a curis votum solvit libens merito.* The author, therefore, was a soldier of the twenty-second legion, Caius Vitalinius Victorinus, who, having without doubt escaped shipwreck on the lake, had vowed to raise an altar to Neptune, the god of the waves, and by a singular chance the whole stone of the Jura which testifies to the fulfilment of his vow has been preserved by falling into the very waters from which he was saved. This deity was doubtless widely worshipped on the shores of the lake in the olden time. There is still in the harbour of Geneva a huge erratic block, known as the Pierre de Niton (Neptune), on which, according to tradition, sacrifices to Neptune were made, and traces of the *culte* may yet be found in song and story. Notwithstanding the beauty of the characters, the inscription of Vitalinius is not considered to date further back than the end of the second, or the beginning of the third century. The word *ACVRIS* should probably read *a curis*, and signifies that Vitalinius was entrusted with one of the special missions for which soldiers were generally chosen, such as inspecting a custom-house, levying taxes, or surveying roads. Besides this altar stone, several other objects have lately been found in the bed of the river; among them are the upper part of a tin vase representing, in relief, Diana and Endymion, and a transparent stone cut in facets; the latter, if not false, will be highly interesting and valuable.

### THE ROYAL MINT.

THE fourteenth annual report of the Deputy Master of the Mint has just been issued, and is the first report dealing with a complete year of work since the reorganisation of the Mint buildings and machinery.

The old books and papers of the Mint, it appears, have been subjected to thorough examination and classification, under the direction of the Deputy Keeper of the Records, and a schedule has been prepared of all documents which should, in the opinion of the Master of the Rolls and the Master of the Mint, be destroyed, and of those which should be preserved. This schedule, as finally revised, will be submitted for the approval of the Master of the Rolls, and will then be laid before both Houses of Parliament. The books and papers not considered worthy of preservation will, at the expiration of four weeks' time, be destroyed.

The only additions of coins of past reigns made to the Mint Collection during the year were a guinea of Charles II. and a guinea of William III., which formed part of a parcel of twenty-two coins said to have been found in pulling down some buildings in Ayre Street, Chancery Lane, and sent to this department, as is usual in cases of treasure trove, for examination. The coins did not possess any special numismatic value, but the two pieces, of which no specimens were included in the Mint Collection, were purchased by the department at a price slightly above their value as bullion.

The melting and coining operations of the year were both very large, but the department, as newly organised in 1882, had no difficulty in meeting the demand both for Imperial and Colonial coin. The second rolling-room was in constant work during the year, and the use made of duplicate engine-power and duplicate machinery in the various stages of coining abundantly showed the necessity for the changes effected. Two metals were with but little intermission melted and coined simultaneously throughout the year, and the increased number of the coining-presses has made it possible to strike, when necessary, more than half a million pieces in a single day. The new machinery in all its branches has worked with smoothness and regularity, and from the date of the resumption of coinage operations in December 1882, there has been no suspension of work in consequence of even temporary derangement. When it is considered that new machinery almost invariably requires at least some adjustment before it can be said to be in perfect working order, this result must be taken to be highly satisfactory. Since the beginning of the current year sanction was obtained for the purchase from the Metropolitan "Brush" Company of the plant necessary for lighting the front of the Mint buildings, and the larger rooms of the operative and assay departments, and the system of electric lighting has therefore been permanently adopted. Its use has been attended with much advantage, and may gradually be extended to other parts of the Mint.

The Mint being authorised to strike the medals required for the International Fisheries Exhibition of 1883, nearly 1,300 medals in gold, silver, and bronze were delivered during the year. The design for this medal was made by Mr. Lewis F. Day, and the die engraved by Mr. John Pinches. On the obverse is the effigy of Her Majesty, which was designed and engraved by Mr. Leonard Wyon, modeller and engraver of the Mint, with the inscription "Victoria Regina." The reverse represents the various kinds of well-known fish, with a fishing net, and the inscription "International Fisheries Exhibition, 1883."

### THE WELLINGTON STATUE.

ON Monday morning, the 19th inst., the statue having been handed over to the military authorities, a number of artificers from the Arsenal were set to work erecting scaffolding and in punching off the heads of the rivets which held the head of the Duke to the body. On Wednesday morning the head with its cocked-hat and plumes was deposited on the ground. A curious discovery was then made in the interior of the Duke's cocked-hat, in the shape of a perfect bird's-nest. The nest had been built on the crown of the Duke's head, and entrance to it was effected from under the ends of the great plume at the point of the hat. The dimensions of the hat are 4 feet long by 1½ foot high, the plume measuring 3 feet across, and the head and hat weighing about half a ton. It was found by Colonel Close on inspection that the monument had been cast in a great many pieces, four of which were rivetted together with bolts, the others being forged together at the foundry, and therefore not being capable of division without injury to the work. The four rivetted portions were the head and body of the Duke, and the head and tail of the horse. Before these were divided it was necessary to find the position of the bolts from inside. A workman of medium size was hoisted for this purpose up to the neck, now bereft of the head, and he, with the greatest ease, slipped through the Duke's collar into the hollow bodies of the rider and the horse. He found plenty of room to stand up and walk about inside with freedom. The body of the Duke, he found, was joined a little below the sword-belt, the horse's head from the withers to a point above the breast-plate in front, and the tail at the crupper. Throughout the metal was not less in thickness than half an inch, in some places being as much as 2½ inches thick. The legs of the horse were solid, in order to support the weight of the statue, computed in all at 30 tons. The whole monument, with the exception of the plume, which is of copper, is made of gun-metal of rather inferior quality, being that of guns captured by the Duke in his various engagements. The workmen have since been engaged in cutting the screws which held the trunk of the Duke to the horse's back, and on Saturday it is believed that the work will have advanced sufficiently to allow of it being taken down. When this has been completed, the horse will be turned upside down and placed on its back on a specially-constructed truck now being built at Woolwich Arsenal. This will have to bear a weight of over 18 tons. It will be fully a month before the monument is ready for starting for Aldershot, and it will

be some time on the road, as a circuitous route will have to be taken to avoid weak bridges, hills, and archways. Mr. Boehm is busily engaged in modelling the new statue, but the work has not sufficiently advanced to permit inspection, though before it is cast it will be open to view. The spurs of the now partially-demolished statue, which were thought to have been lost, are in safe keeping at the Offices of the Board of Works. The statue will be re-erected outside the headquarters of the Aldershot garrison.

## YORK ARCHITECTURAL ASSOCIATION.

ON Saturday last the above Society commenced a series of visits to be made during the summer months to places of special interest. The list includes Whitby and Kirkstall Abbeys, Bridlington and Howden Priory Churches, York and Ripon Minsters, St. Mary's Abbey, York, and the Yorkshire College and the Coliseum, Leeds. On Saturday, therefore, a large number of the members visited Leeds. Arriving at Marsh Lane, the party, by the invitation of Mr. Jas. Holroyd, proceeded to inspect the Terracotta and Faience Works of Messrs. Wilcock & Co., at Burmantofts. Mr. Holroyd accompanied them through the various departments of the works and explained the different processes of manufacture. After the inspection Mr. Holroyd entertained the visitors.

## BUILDWAS ABBEY.\*

BUILDWAS, for its first twelve or thirteen years, belonged to the Savigniac Order. Vital de Mortain, first abbot of Savigny and founder of the Order, died in 1122. St. Bernard, about eight years previously, had founded Clairvaux. An intimacy subsisted between these two men. The energies of both were directed to a reformation of the Benedictine Order. When Savigny was founded, in 1112, the Cistercian rule, although originated in 1098, was yet incomplete, and its ordinances were not fully settled till the first Chapter General, held at Cîteaux in 1119, at which St. Bernard, as Abbot of Clairvaux, was present. In 1147, Clairvaux being still under the Abbot of St. Bernard, and having acquired an extraordinary importance, the respect of the first Abbot of Savigny for its head, and the institutions under which he ministered had ripened in the fourth Abbot of Savigny into a desire for a complete union with and assimilation to the Cistercian Order. Thus, between 1147 and 1148, Savigny, with upwards of thirty dependent abbeys, among which was Buildwas, became subject to Clairvaux.

Buildwas was founded in 1135, only twelve years before the union of the two Orders. But the foundation of an abbey by no means implies the commencement of its permanent buildings, and many instances may be cited of this. Temporary erections were sometimes resorted to, and a start made in the intended work, waiting till means afforded the opportunity for the erection of the permanent structure, just as in these days a temporary church is often succeeded by a permanent one. The choice of the site of an abbey seems always to have had great care bestowed upon it, and none better could have been selected than that of Buildwas. To the north flows the Severn; to the west a tributary stream which was made to fertilise the broad meadows which stretched along the northern bank of the river; to the south-east there extended a vast wood the reclamation of which was part of the programme of the inmates of the abbey.

The waters of the valley which runs up southward of the abbey were made to serve for working the abbey mill and for the supply of the fishponds to the west of the abbey buildings, and it may be to the abbey itself. The pond to the south-west, now dry, was probably the mill-pond, below which the mill was situated, and its tail water flowed down first to the fishponds to the north-west, and then to the meadow land between the abbey buildings and the river, all of which may even now be distinctly traced. This mill-pond was just outside the enclosed abbey precincts, as may be seen from the fragments of wall running east and west near to the north end of it. This wall was 2 feet 6 inches thick, and was built of squared stones on both faces, as may still be seen in several places. Near to the east bank of the tributary stream may be traced what would appear to have been the western boundary, and to the north of the fishponds the southern boundary on the riverside. A fishpond nowadays conveys the simple idea of sport; but not so with the monks, for it must be borne in mind that their diet consisted largely of fish, and the "cultivation" of its growth was an important part of the economy of their establishment, and for this reason their elaborate system of what are known as "stews" prevailed as surely as did their buildings.

Of the great entrance to the abbey precincts nothing now remains, but it was probably near to the south-west corner of the site, not far from the length of outer wall which still remains.

Nearly opposite this there is a hollow between two mounds which may indicate this entrance. At the entrance was stationed a porter, who regulated admission to the abbey and reported the presence of guests to the abbot, who visited them here, and after they had attended a "service," as we should say, in an adjoining oratory specially provided for the purpose, were entertained by the abbot in apartments known as the "hospitium." At the entrance alms to the poor were also distributed. Within a court next to the entrance were arranged the workshops of various descriptions, where the clothes of the inmates were made, and where those engaged in the work of repairs and of building on the estate were accommodated, as well as the other trades essential to a large and isolated society. Separate from these stood the church and its appendages, and the rooms and dormitories used by the monks themselves, including those old or infirm or sick, as well as those active and strong, and fulfilling all the minutiae of their religious vows. In the general arrangement of their buildings the church was always the most important and prominent feature. No matter how large the establishment, there was no exception to this rule.

The relative position of the church and buildings took different forms, regulated by the peculiarities of site, the advantages of which seemed always to have been duly balanced and the best choice made. In most cases the conventual buildings were placed to the south, but in this case at Buildwas they are on the north side, the higher level on the south being chosen for the church and the more sheltered and lower level next the river for the buildings. The church itself was always placed with its longer axis east and west. The present remains are extensive, the principal being those of the church and the buildings immediately north of it. Besides these there is further north an arcade of five arches running east and west, and the south and west walls of the abbot's house, and the east and south walls of the abbot's chapel, all of which, with some other walling, are incorporated in the house now known as the Abbey. The style and character of the original buildings exhibit the features and details common in the early years of the latter half of the twelfth century, and they were probably erected between the years 1150 and 1170. The church consists of nave, with north and south aisles, seven bays in length; north and south transepts, with two eastern chapels to each, a central tower, and a chancel. The internal length of the nave is 100 feet, and the total length from west to east is 156 feet. The nave and chancel are in one unbroken line from end to end. The transepts project 24 feet 4 inches each north and south. The east wall of the chancel, against which stood the high altar, has now three windows of considerable height; but it is evident that originally there were six windows in this wall, three ranging with the window on the north side and three below. The arches and hood mouldings of these original windows are apparent, and it is clear that the horizontal string-courses have been cut through and the walling between the two heights taken out, so as to convert them into the three lancet windows as at present seen. The window on the south side has been treated in the same manner. On this wall and throughout the buildings the original mason's marks are distinctly visible; a double triangle is to be seen in many parts of the church and elsewhere. In the south wall of the chancel is a sedilia of three seats and an aumbry; the latter is of original construction, but the former has been inserted at a later date. It is very beautiful in its design, and displays an excellent example of dog-tooth carving in the hollow moulding of its arches. The north wall contains one window, which originally ranged with the upper windows of the east end, and shows what those windows were.

The chancel was divided into two bays by groined arches, which were quadripartite, the springers of which still remain both at the four angles, and in the centre of each flank wall. The variety in these springers, and their exquisite beauty of design, is to be specially noted. The internal facings of the chancel, and of the walls of the church generally, are what may be termed rough ashlar, the stones being coursed, but not truly squared, and having wide joints. These facings were plastered, the remains of which are to be seen in the splays of south window, in the walls of the tower, in chapels, transepts, aisles, east gable of south aisle, and elsewhere. The joints of the walling everywhere have been filled with red tiles, and this prevails even in the remaining fragment of the south boundary wall.

The intersection of the nave and chancel with the transepts, called "the Crux," is formed of four bold-pointed arches, with a square-edged sub-arch and a hood mould, all started from corbelled springers, the walls above rising in the form of a low tower, in which there are two windows in each face, and at the south-east angle there is a stair turret. Beneath the windows was a floor, the ends of its beams being still seen, so that the tower did not take the form of a lantern inside the church. Its roof probably started immediately above the heads of the side windows, as there was a clear intention of keeping the walls low; the sills of the windows being placed as close to the abutting roofs as possible. The projecting lines of the rakes, and the grooves in the walls of the four gables starting from the tower, are still in their place. The internal height of the window is to be seen on the north side. The tower was not groined; its walls are 5 feet in thickness. The four eastern chapels to the transept are similar in design. They

\* From a paper read by Mr. Charles Lynam, of Stoke-on-Trent, Diocesan Surveyor, on occasion of a visit paid by the members of the North Staffordshire Naturalists' Field Club.

had a quadripartite vault, but the ribs of the groining are all gone, the springers alone remaining. To the east was a single-light window, with a string course below its sill, below which there stood an altar in each chapel; on the south side of each is an aumbrye recessed within the wall, and also a drain from a piscina, which projected from the face of the wall. The plaster facing to these chapels is distinctly visible on the south wall of the north chapel. This plastering was not the thick coat which we now put on, but a thin, hard lining of coarse material. There are a few stones in the walls of these chapels which appear to bear marks of carving of an earlier date than the church itself. The arches to these chapels are of the simplest form, and the walls in which they are placed are 5 feet 6 inches thick. The rebate for the door of the aumbrye is to be seen in the north chapel. The transepts are of two bays; the walls have a plain splayed base course, a string below the windows, and another at the level of the abacus of the tower piers. At the south-east angle of the south transept is a stair turret which led to that at the corresponding angle of the tower, and there is a doorway in the south gable near to the west wall. The south gable is 4 feet 9 inches thick, and appears to have had two windows like those at the west end of the nave. The transepts were not groined, nor the tower, nave, or aisles. The chancel and chapels alone were vaulted. In the gable of the north transept there is a doorway to the vestry, with steps down to its lower level. Also a doorway now blocked up from the dormitory of the monks. The holes in which the handrail was fixed are still apparent. The lower stones of an elaborate screen between this transept and the north chapel still remain.

The body of the church has seven bays. Its eastern piers are octagonal and all the others cylindrical. The three eastern bays formed the presbytery, and were screened off by walls about 7 feet high above the level of the floor. The remainder of the nave was also screened off by walls about 4 feet 6 inches high, leaving the aisles as processional paths only. There was one entrance into the church near the west end of the north aisle, and another at the east end for the monks from the east walk of the cloister. The evidence of the screen walls to the nave arcades is perfectly distinct from the appearance of the masonry in the lower part of the piers, and from the fact that the base mouldings are only continued to the aisle side of the columns and the cross-screen is marked by the masonry of the third pier from the east. The former presence of timbers at the west end, and also at the east end, and in the second piers from the east, are marked by the holes which received them. The shafts to western arch of tower are stilted so as to start above the screen walls.

The diameter of the nave columns is 4 feet 6 inches, and their height between cap and base 8 feet 8 inches to presbytery, and 10 feet 10 inches at the west. One of the tower windows next the nave has its original form complete in every respect. Of the roof of the nave nothing remains except that its pitch is distinctly marked against the wall of the tower. The west end of the nave has two large windows in the lower part, with apparently three smaller ones above. The absence of the usual west doorway is remarkable, and is peculiar, if not unique. The internal arch of the clerestory windows was carried by nook shafts, with carved capitals. A string runs below the sills, and at the level of the spring of hood mould. The corbel table on the outside of the north wall of the nave is still in its place for a short length. The western gables of the aisles still remain, but the flank walls are gone. These gables had each a window to the west, and the rake of the lean-to roofs is distinctly marked at the east end. The chamfered plinth course runs at the foot of these walls as well as elsewhere. The holes which received the ends of the timbers carrying the wall plates at the head of the roof remain, and in two cases the ends of the timbers are still to be seen. The thickness of the aisle walls is 3 feet. Externally, the west end of the church has angle and two central buttresses, with weatherings to the projecting base courses. There are very skilfully cut chevrons, and other enrichments, in the arches of the windows. The staircase at the south-east corner of the south transept has projected beyond the face of the wall, and there is a central and end buttress to this gable. The chapels east of the transept have an angle and a central buttress, and the rake of the lean-to roofs is visible, as well as the corbel table and eaves cornice. Also, string mould under the windows, which have hood moulds. The east gable has two central and angle buttresses, and weathered base mould. It will be noticed that all the windows throughout are in single light—there is no approach to anything like grouping in them. They are all circular-headed, and have strings beneath the sills and hood moulds to the arches of the heads. There are no grooves for glass visible, but holes which received the cross-bars are to be seen.

The whole design of this church is characteristic by its great simplicity, its massive construction, yet withal artistic treatment of its several parts, and extreme beauty of its details; and, further than this, the constructive skill which it exhibits is extraordinary. Look at the rough and rude filling of the vaulting to the chapels, where mere covering had to be provided, and then turn to the exquisite masonry of the columns and arches, which had to carry ponderous weights, and the scientific skill of the builders must be fully acknowledged. It will be seen that all the main constructive arches, such as the arcade of the nave, those to the tower, and to

the eastern chapels are of the pointed form, whilst those to the minor features, such as windows and doors, are semicircular. There has been much speculation as to the origin of the pointed arch, and it has been put down to accident and all manner of fanciful notions; but the real student of Gothic architecture knows that it arose from a structural necessity in the covering of spaces by means of the vault, and everyone who has examined with care the early application of the pointed arch knows well that the ancient builders employed it simply for its scientific and artistic effect. The best view of the interior of the church is perhaps from the west end, looking east, whence the arcades of nave and the arches of tower, aisles, and chapels are seen to perfection. Leaving the church, the first place to be entered is a crypt which lies under the end of the north transept and one chapel. Its ingenious entrance is from the east walk of cloister. It is vaulted in three bays, and a cross arch carries the massive wall of the chapel above. Between the western bays of vaulting there is a central rib as in the eastern chapels; the other groin ribs have gone. It was lighted by a window at the east end, which has now been turned into a doorway. In this crypt is to be seen what was the usual treatment of the rubble filling to the vaults, one of the bays retaining its original plaster facing. The care taken in the filling at the keys and at the groin points is well worthy of notice. This crypt, it has been suggested, was for the purpose of receiving the bodies of the monks after death, and in preparation for the last rites of their religious faith. This seems probable, as it was entered conveniently from the cloister and was next to the church.

The next apartment is the sacristy (now used as a passage). It has an entrance from the cloister-walk, and now another from the garden to the east, where originally was the window which lighted it. This is also groined; the only rib remaining is the one in the centre of its length. On the north side are two recesses in the thickness of the wall, with circular arched heads. They were probably used as cupboards for vestments, &c. Next to the sacristy is the chapter-house, where the monks met for the transaction of the business of their community. It is a remarkable apartment in many ways. On entering it everyone must be struck with the extreme beauty of its design, with the lightness of its construction—contrasting forcibly with the massive work of the church—and with the artistic delicacy of its details in mouldings and carvings. The proportion of height to diameter of the nave columns is a little more than 2 to 1—here, they are  $5\frac{1}{2}$  to 1. The level of the floor is considerably below that of the cloister-walk, from which it was entered by steps. The natural fall of the ground dictated this in a measure; but there can be no doubt that it was the determination of the monks to have a handsome place of assembly which prescribed this peculiarity. Height could not be obtained upwards, as that would have interfered with the level of the dormitory above. The chapter-house was lighted by three windows to the east and one on each side at the east end; the northern one is now blocked up. The entrance and the arches on each side of it were also open. There are traces of original plaster to be seen both on the walls and groining. The room measures 41 feet east and west, and 31 feet north and south. It is divided by four columns into three bays in each direction, and each bay has a quadripartite vault, the ribs of which are intact. Externally, the arches next cloister-walk are simple, bold, and effective. To the east the three windows have strings below them and hood moulds, also two central and angle buttresses. The part projecting from the main walls was treated as a lean-to, the corbel tabling to which still remains.

Over the chapter-house, vestry, passage, and probably over the ambulatory was the dormitory of the monks, which was roofed in a single span abutting on to the north transept of the church at its south end. The positions of the columns which carried the roof across the eastern projection are shown by their bases, which still remain. The range of windows looking west with a string at their sill are also still in their place. Beneath the floor of the chapter-house, according to Cistercian rules, repose probably most of the abbots. Within the chapter there is a collection of very interesting fragments found in and about the abbey precincts, amongst them several stone coffin lids of great interest and beauty. One stone bears part of an inscription incised therein; it appears to be in Norman French, and reads "Hue: le: fiz: "

Next to the chapter-house northwards is a passage from the cloister to the gardens lying east of the church. It has a groined roof, and the dormitory extended over it. Immediately abutting upon this passage is the end of a return wall which ran westwards with the springer of an arch in it, and no doubt this range formed the north side of the cloister. The staircase to the monks' dormitory was probably in this part, abutting on to the next apartment, the remains of which are considerable. It has been termed an "ambulatory" where the monks mustered in common for the enjoyment of as much relaxation as their rigid rules allowed. Its three arches to the east still remain, massive in character, and open to the air. The walls bear evidence that this room was groined, and it is pretty certain that it had two central columns after the manner of the chapter-house. The level of the floor above this room corresponds with that over the chapter-house, and in all probability the monks' dormitory extended over it. To the east of this room, and about twenty-five yards distant,

stood the abbot's house, the west and south walls of which are still discernible. That to the east has five single light windows in it of peculiar and interesting treatment, and over these are quatrefoil and trefoil windows, which (though this has not been observed before) appear to me to have been dormers. At the south-west angle of the abbot's house was the abbot's chapel, part of the east and south walls of which are still to be seen. One cannot but admire the abbot's choice of the site for his lodging. Apart from the traffic of the cloister, and other busy parts of the monastery flanking to the south, overlooking the gardens and hills to the east, and commanding a view of the east end of the church and monastery, no place could have been better chosen.

Between the abbot's house and the building before called the ambulatory, a small cloister square was formed, to the north of which it is supposed that the infirmary stood, its flank against this small cloister being formed of an arcade of five bays, the columns and arches of which still remain, against the responds of which the ends of abutting walls are seen, showing that there were other buildings extending northwards from each end of this arcade. It should be noticed also that the northern faces of these arches indicate that the apartment they enclosed had a groined roof, and it is probable that in this, as in the ambulatory, there was at least one row of internal columns. There are indications of string courses, and other features, which show that this little cloister was surrounded by a pent roof abutting against the buildings forming the square, and the southern arch of the ambulatory has the raking weathering of a gable showing that between it and the abbot's chapel there ran a span roof. In the present coach-house is a stone lintel over an opening very elaborately carved.

In looking at the east side of the church and all the buildings north thereof, it should be borne in mind that the present level of the ground is much higher than it was originally, by reason of which the lower parts of the buildings are buried to a considerable extent. The northern side of the great cloister court was no doubt occupied mainly by the refectory, which ran north and south, and the kitchen and buttery. The western side provided accommodation for lay brothers, stores, &c., and in the middle of it an archway ran through it which was the main entrance to the monastery proper. Between this western range and the cloister there was an open passage through which the church was entered near to the west end of the north aisle. In engravings of the buildings made some years ago, the arch, which was blown down in 1823, between this open passage and the west wall of cloister is shown, and there are still indications on the ground of its position, as there are also of the extent of the western range of buildings near to the old thorns by the side of the dry fishpond.

The number of monks originally on the foundation is not known, but it has been calculated that the choir would accommodate about thirty-four. At the time of the suppression there were only nine, with thirty-six servants. The lay inmates are said to have been usually not less than five times that of the monks. It has been suggested that the monks of Buildwas, having built their monastery, stood still in inactive content and opposed to further progress, as their buildings do not indicate alteration or addition subsequent to the thirteenth century. But it surely may be said that the original founders closely calculated the needs of the community, and designed their buildings accordingly; and as no accession in numbers of any importance occurred, the successive generations went on in contentment, and, without change, housed and accommodated in a domicile well planned, and built in a manner which pillage and exposure for more than three hundred years have not even yet reduced to erasure.

### THE JAFFRAY HOSPITAL, BIRMINGHAM.

THE designs for the Jaffray Suburban Hospital, of which the foundation-stone is to be laid on Wednesday next, have been prepared by Mr. H. R. Yeoville Thomason, of Birmingham. It will consist of a central portion, with two boldly projected wings, and will afford accommodation for fifty patients. If it should be required, extensions may be made for fifty more patients by adding wings to the rear, without interfering with the harmony of the internal arrangements, or affecting the architectural symmetry of the buildings. The central block is to be devoted to administrative purposes, and the wards occupy the two wings, and as the whole group of buildings front towards the south, the wards will have the sun falling upon one or other of their sides throughout the day. The hospital will be two storeys high, and the entrance to it will be by a central porch, facing a curvilinear carriage drive and lawn. Upon the ground floor there is an entrance hall, 17 feet by 13 feet, and beyond it, running right and left, a spacious main corridor leading to the wings. To the left of the entrance hall, and communicating with it by wide folding doors, is the waiting and receiving room, and close to this are the dispensary and dispensary stores. The three apartments communicate with one another *en suite*, but they have each of them separate doors into the corridor. Upon the right of the entrance hall there are, similarly placed, the surgeon's sitting-room and the officers' dining-room the latter measuring 20 feet by 15 feet.

Beyond the transverse corridor a sub-corridor conducts to the kitchen, serving-room, housekeeper's room, and other domestic offices, where a back entrance is also provided. At either end of the main corridor is a staircase hall with stairs to the upper floor, and a sub-corridor leading to the wards.

The west wing is intended for male and the east for female patients, two wards—one on the ground floor and the other on the first floor—being allotted to each class. A description of the ground-floor male ward answers for them all. It is entered from the end, and is 54 feet 6 inches long by 24 feet wide, with a height of 14 feet. As it is arranged for twelve beds there will be a cubical space for each patient of nearly 1,500 feet. It is planned in such a manner that a window is arranged between every two beds, securing abundance both of ventilation and of light. The ward has five windows overlooking the front lawn, four upon the opposite side and three at the end. The floor will be of oak, and the walls will be plastered for painting. In addition to the ventilation furnished by the windows, fresh air will be introduced by Tobin's tubes, and circulation maintained by Boyle's extractors, in connection with which will be air-passages between the ceiling and floor above, communicating with vertical shafts. Two open fireplaces in the ward will assist both the heating and ventilation, and hot-water pipes will also be laid on. Near the entrance to the ward is a ward-room for the accommodation of special cases requiring separation from the rest of the patients, and a kitchen or nurses' room. A small projecting building near the junction of the wing with the main building furnishes the various sanitary offices for each ward. The eastern or female wing exactly corresponds with that just described. In each case the first floor repeats most of the features of the ground-floor plan; it gives a second ward to each wing similar in dimensions and accommodation to those below.

In the central block there are in front the matron's sitting-room, bedrooms for other officers, and at the rear over the kitchen and stores are four bedrooms for the night nurses. A third storey in the roof of the central section affords sleeping accommodation for the servants and day nurses. Two lifts are provided near the centre of the main corridor, one of them for patients and the other for culinary uses. There is a considerable fall in the land, so that the boiler-house, coal-stores, and other conveniences will open upon a yard which will be of use in many ways.

The building is in the Queen Anne style, and composed of red brick, with terra-cotta mouldings, string courses, cornices, and window archings.

### ARTISANS DWELLINGS IN BIRMINGHAM.

A SPECIAL committee appointed by the Birmingham Town Council to inquire how far the dwelling-house accommodation for the artisan and labouring classes in the borough is sanitary and adequate, and what amelioration it is in the power of the Council to effect, have made their report. From the report it appears that in every ward in the borough there is a large number of void houses of the class under inquiry, and it is shown that out of 65,969 houses within the borough at 7s. per week and under, 5,273, or nearly 8 per cent., are void, these "voids" pretty evenly distributed through all the wards of the borough. The greatest number of insanitary dwellings were found in St. Mary's and St. Bartholomew's Wards, old, small house property, badly arranged, and built in a confined and insanitary manner. Much of the old property had fallen into a very dilapidated condition, but in most cases the leases will expire in the course of a few years, and the properties will probably be pulled down. In Bordesley and All Saints' Wards were a large number of "jerry building" houses, built of improper and unsubstantial materials, and of inferior workmanship. So far as the committee could ascertain, none of this class of buildings had been erected since 1876, the year when the Council adopted a code of by-laws with respect to new buildings, and appointed a building surveyor to see that such by-laws were carried into effect.

In considering the amelioration possible to be made, the committee have had their attention called to the desirability of a more complete supervision of new buildings, with a view of seeing that the by-laws were strictly complied with. In 1876, when the by-laws came into force, and the building surveyor was appointed, 2,903 houses and shops were erected, but that number has gradually declined, until in 1882 only 666 new buildings were erected, and in 1883, 938. In the opinion of the borough surveyor the present staff, which includes two clerks of works (one specially appointed to superintend the construction of drains), in addition to the building surveyor, is sufficient; but if the number of new buildings erected should again assume the proportions of 1876 and 1877, further assistance will probably be necessary. At the present time five inspections of each building in course of erection are made, and are considered ample. The committee are, however, of opinion that not only should compliance with the deposited plans, and with the by-laws as to thickness of walls, &c., be insisted upon, but that extreme care should be exercised in the supervision of materials used in the course of construction. They are also of opinion that no house should be allowed to be inhabited until it

has been examined by some competent officer of the Council, and a certificate given by him that such house is fit for occupation. As regards the staircases, which in many of the existing houses are not only dark, steep, and narrow, but positively dangerous, the committee have ascertained that by a curious omission from the Public Health Act, 1875, the Council had no power to interfere with their construction, but that by the Birmingham Corporation Act, 1883, the Council were empowered to make by-laws with reference thereto, and that such by-laws are now under the consideration of the Public Works Committee.

In consequence of the increasing value of land within the borough, and the consequent increase of rents, the advisability of the erection of workmen's dwellings in "flats" was suggested to the committee, as by that means several dwellings could be erected for one ground rent. The committee consider, however, that the erection of dwellings in "flats," as generally understood, consisting of several storeys, the one building holding several families, is not desirable; and there was a consensus of opinion on the part of the witnesses, and especially of the working men themselves, that such a system was not adapted to the English workman, who preferred a self-contained dwelling. The attention of the committee was, however, directed to dwellings of two storeys, each storey being complete in itself, and having separate means of entrance. Such a system might, in the opinion of the committee, be tried with advantage on a small scale as a means of providing good accommodation at a comparatively low cost.

In arriving at their conclusions, the committee are convinced that at the present time there is adequate dwelling-house accommodation for the artisan and labouring classes in the borough, and that there is no special necessity for the erection of additional dwellings. The dwelling-house accommodation in the several wards was, generally speaking, found to be in a fairly sanitary condition. The committee consider it desirable that some model dwellings, constructed upon the best sanitary principles, and let at reasonable rents, should be built and serve as models for workmen's dwellings which may be erected hereafter. The committee do not recommend that this work should be undertaken by the Council, but they consider that for many reasons it is one which would be best undertaken by private enterprise, and they believe that in Birmingham there is sufficient public spirit to carry out the recommendations now made. Among their recommendations the committee suggest that all new houses should be certified by some competent official before the same are allowed to be inhabited; that extreme care should be exercised by the building surveyor in the supervision of the materials used in the construction of houses; and that the staircases of new houses should be better constructed.

## REVIEWS.

**THE STUDENT'S PRACTICAL GUIDE TO MEASURING AND VALUING ARTIFICERS' WORK.** Fifth Edition. By E. WYNDHAM TARN, M.A., Architect. (Crosby Lockwood & Co.)

It is unnecessary to eulogise a book like "The Guide to Measuring," which has secured by its intrinsic worth so permanent a position in professional literature. The late Mr. Edward Dobson, who was the original editor, had a talent for book-making, and it has been supplemented by Mr. Tarn's scientific skill. The guide contains sufficient elementary information to enable beginners to use it, and there are so many tables and memoranda, that it can be often turned to account in a surveyor's office.

**HINTS ON THE DRAINAGE AND SEWERAGE OF DWELLINGS.** By W. P. GERHARD, C.E. (New York: W. C. Comstock.)

The necessity for effective sanitary appliances is apparently more urgent in the United States than in England. The skill which the Americans have shown in making shams that are deceptive to knowing people appears in house drainage, and many a shrewd proprietor in the cities has paid high prices for things which are less valuable than wooden nutmegs, since they are more dangerous. Even the simplest class of work can be converted into a snare by the skill of the workmen. Mr. Gerhard tells us that "there is scarcely another detail in a system of drain-pipes for a dwelling in which so much rascality or criminal stupidity is shown than in the manner of making joints on an iron pipe. Such pipes are often jointed with paper, covered with sand, or else some cheap mortar is thrown into the space between spigot and socket; in other cases putty is used or red lead. Wherever joints are in sight some lead is perhaps poured on top of the sand to give the joint the appearance of having been done with the proper material." In a country where such malpractices are to be expected, it is requisite that ingenuity should be exercised in order to limit the workman's opportunities of doing evil, and American sanitary engineers have endeavoured to introduce appliances that in laying shall be attended with a minimum of risk. In Mr. Gerhard's book there are descriptions of the best English and American inventions, and it suggests what advance has been hitherto made in sanitation on both sides of the Atlantic. The writer is impartial in his selection and in his descriptions, and we assume that his interestedness does not lie in any particular invention. The book has nearly three hundred diagrams.

## WORKS IN PROGRESS.

**North Ormesby.**—The gas-fittings throughout for the Wesleyan chapel, North Ormesby, near Middlesbrough, consisting of coronæ brackets and pendants, have been supplied by Messrs. Jones & Willis, of Birmingham and London.

**The Patent Fanlight Opener** of Mr. R. Adams, of Great Dover Street, has been selected in competition for the Great Eastern Railway Hotel, Liverpool Street. The order is the largest received by Mr. Adams for any hotel in this country. It is not long since he received a large order for fanlight openers with the patent safety screw regulator for the Parkestone Hotel, Railway Station, and Shipping Office. These acquisitions to health and comfort are eminently suited for such places, as visitors are enabled to regulate their ventilation without risk or aid, and its neatness well accords with the luxurious surroundings.

**Non-arsenical Wall Paper.**—The walls of the corridor surrounding the Water Companies' Pavilion at the International Health Exhibition have been papered with Messrs. William Woollams & Co.'s non-arsenical washable papers, the upper part sienna and the lower part rouge royal marble, by special desire of Col. Sir Francis Bolton.

**The Indestructible Paint Company, Limited**, have received an order from Mr. T. Graham Jackson, the architect, of No. 2 Kensington Court, to supply "Browning's Patent Paint," of which the company are the manufacturers, for the whole of the work of this building.

## ARCHÆOLOGY.

**A Roman Villa** has been discovered at Woolstone, in the Vale of the White Horse, Berkshire, and some fine tessellated pavements have been disclosed. Several interments have also been disclosed, apparently of the Anglo-Saxon period. The seax or knife-dagger is, strange to say, still attached to the girdle of two of the bodies, presumed to be those of Anglo-Saxon ladies.

**Pontefract Castle Grounds.**—During the progress of the drainage scheme being carried out in Pontefract, some interesting discoveries were brought to light. A well has been discovered near the Booths, which in all probability was used by the inmates of St. Nicholas's Hospital, at one time the oldest foundation in Pontefract. In crossing Grange Field, where stood the Priory of St. John the Evangelist, founded by Robert de Lacey in the time of William Rufus (1090), some vestiges of the monastery have been brought to light, and it is believed by some antiquarians that the foundations of the structure still remain intact, buried at no great depth. During the excavations other interesting relics have been found in the shape of pottery ware, &c. A museum is in course of preparation, where many objects of interest connected with the past history of Pontefract are to be preserved.

## ENGINEERING WORKS.

**Dock at Maryport.**—A new dock constructed at Maryport has been opened. The dock is 850 feet long by 300 feet wide, and a passage 50 feet wide. The depth of water on the dock sill at ordinary spring tides is 25 feet. The dock and basin cover an area of 10 acres, and these improvements at Maryport make the port the largest of any between the Mersey and the Clyde, with the exception of Barrow. The total cost is about 220,000*l.* Mr. Doherty, of Dublin, is the contractor, and Sir John Hawkshaw, Son & Hayter, London, the engineers.

**Steam Tramways.**—On Tuesday morning the official inspection of the new line of tramways from Dudley to Stourbridge took place. The route is 5½ miles in length. It is a single line of rails with passing places at convenient distances. The system of line construction is "Barker's Patent," which consists of a steel rail securely fixed with cast-iron keys to cast-iron continuous sleepers having a broad flange, the sleepers in turn resting upon a firm bed of lias lime concrete. Each single rail weighs 42 lbs. per lineal yard, and each sleeper 112 lbs., or thereabouts, giving 66 tons of steel rails and 176 tons of cast-iron sleepers for each mile length of single line of two rails. One strong point claimed by the inventor in favour of this particular kind of rail is that a length of rail may at any time be replaced in the sleepers without necessitating the removal of the paving. The dépôt and grounds, Tipton Road, Dudley, contain an area of some 1,200 superficial yards. Accommodation is provided for eight engines and eight cars, and there are also erected suitable buildings for board-room, offices, repairing shop, coke and oil stores, &c. The engines are those known as "Kitson's," and are of locomotive type, having surface air condensers. They are constructed to meet the requirements of the Board of Trade, and they can be worked from either end. Automatic steam and other brakes of great power are provided, and complete control of the engines can be had by the driver when ascending or descending the various steep hills upon the route. The weight of each engine is about eight tons. The cars, supplied by the Starbuck Company, of Birkenhead, are

specially constructed for steam traction, and have two four-wheeled bogie frames. The cars are provided with powerful brakes, which can be applied by the driver of the engine or the conductor on the car from either platform to the whole of the eight wheels at the same time. The entire works of line and depot construction have been carried out by Mr. John Fell, contractor, of Leamington, from the design and under the personal supervision of Mr. E. Pritchard, M.Inst., C.E., of London and Birmingham.

### CHURCH BUILDING AND RESTORATION.

**Desford.**—The parish church of St. Martin, at Desford, has been reopened after thorough interior restoration. The architect under whose supervision the work was carried out was Mr. Stockdale Harrison, of Leicester. Mr. A. Dilks, of Desford, had the contract for the chancel, and the altar rails were supplied by Mr. Elgood, of Leicester. Mr. Hewitt, Leicester, erected the vestry and supplied the altar table, reading-desk, &c., besides reseating the church, and Mr. Cunningham, of Leicester, did the stonework in the nave. The total outlay will be nearly 2,000/.

**Stratford-on-Avon.**—On Saturday Mr. Mackeray Turner, with whom was Mr. Micklethwaite, of the Society for the Preservation of Ancient Buildings, visited Stratford-on-Avon for the purpose of making an examination of the parish church, and advising on the subject of its restoration. Numerous letters have been addressed to the mayor describing the proposed restoration as an act of vandalism, and even urging the public to subscribe to a fund for "protecting the church from the hands of so-called restorers." The committee decided to invite the co-operation of the society, which has for its object the preservation of ancient buildings. The committee, which includes the mayor and the vicar and members of the town council and churchwardens, met the society's deputation by appointment at the parish church, on Saturday, and a careful inspection was made of the interior and exterior of the building. After making a minute examination of the tower, Messrs. Turner & Micklethwaite stated that in their opinion there was no immediate danger. The breach was not of a recent date, and there was no indication of its having widened. The roofs of the nave, the north and south aisles, and the chancel were declared to be in a good state of preservation, and the lead-work remains almost intact. It was intimated by the society's deputation that their recommendations would be contained in a report which would be presented to the committee in due course. It was understood that they were in favour of the removal of the galleries, and were also not opposed to the construction of a centre aisle.

### SCHOOL BUILDINGS.

**Honley.**—The Congregationalists of Honley, near Huddersfield, have just opened a new school. The building is of a superior character, and has been erected on the site of the old school, from designs by Mr. B. Stocks, architect, Huddersfield. The school has a large room and gallery capable of seating 600 persons, and nine class-rooms and kitchen. The cost is about 2,000/.

**Olton.**—The foundation-stone of the Olton Church Schools was laid on Monday. The building will accommodate 153 children. The erection is to consist of large school-room, 62 feet long by 20 feet wide, and a class-room 18 feet by 15 feet 6 inches. Its walls are to be of red bricks. The building is so arranged upon the site that additions may be made to it, including a master's house. The work is being carried out under the superintendence of Mr. Benjamin Corser, architect, of Colmore Row, Birmingham, by Mr. William Chaffer, builder.

### NEW BUILDINGS.

**Holloway.**—A block of shops and industrial dwellings, in Benwell Road, has been completed by Mr. W. T. Niblett. The buildings comprise four large houses, three of them having on the ground-floor, on each side of the doorway, a shop, which may be had fitted with a fireplace and be used as a dwelling-house. If used as a shop there is a bedroom and kitchen behind it, with arrangements for range, sink, copper, coal-cellar, dustbin, &c. Behind the shops is a concreted drying-yard for the exclusive use of the inhabitants of the ground-floor. Upon the first floor the rooms are larger. On one side of the landing are four rooms, on the other three. These are all fitted in the same way as those on the ground-floor. The passage between the shops is laid with Staffordshire tiles, and at the end of these are the stairs leading to the upper floors. These are made of stout pitch-pine planks, the wall being coloured at the top and painted. The rooms upon the first floor are spacious. The fireplaces and mantels are of iron, cast into a handsome pattern, with fluted fireclay backs to the stoves, and all the fittings are substantial and good. Upon the top of the houses is a drying ground, covered with perforated flooring.

### GENERAL.

**The Prince of Wales** has undertaken the post of President of the Royal Windsor Tapestry Works, which was held by the late Duke of Albany.

**Count Gleichen** has been elected an honorary member of the Royal Institute of Painters in Water-Colours.

**The Annual National Fine Art Exhibition** was opened, at Madrid, on Saturday last by King Alfonso. The exhibition is in the principal annexe of last autumn's Mineralogical Exhibition, in the park of Madrid.

**The Queen** has conferred the honour of knighthood on Mr. Frederick William Burton, F.S.A., Director of the National Gallery of London.

**A Memorial Statue** of Lord Stratford de Redcliffe, the work of Mr. Boehm, has been unveiled in Westminster Abbey.

**A Bronze Statue** of John Brown arrived at Balmoral on Saturday, and is to be placed on a pedestal erected about two hundred yards to the south-west of the Castle.

**The Royal Archaeological Institute** have issued a provisional programme for this year's meetings, which are to be held at New-castle from August 5 to 13 inclusive. The excursions which have been arranged include visits to Warkworth, Alnwick, Jarrow, Morpeth, Prudhoe, Chillingham, Holy Island, Durham, and other places of interest. The Duke of Northumberland is to be the president of the meeting.

**It is reported** from Athens that while the foundations of the new theatre at Piræus were being laid, the workmen came across indications of an antique structure, which, it is expected, will turn out to be a temple of Dionysius. The building operations have consequently been stopped, and the place is to be excavated.

**Mr. C. W. Digby**, Birmingham, has given a site in the Green Lanes on which to erect new homes for the Birmingham Homes for Destitute and Working Boys. The cost of erection of the buildings is estimated at about 2,000/.

**The Select Committee** of the House of Lords on the Manchester Ship Canal Bill have decided that the preamble had been proved, but exacted from the promoters as a condition of the Bill being proceeded with that a clause should be inserted prohibiting the commencement of the works until 5,000,000/ of capital had been "subscribed and issued."

**The Managers of the Metropolitan Asylums District** have applied for the consent of the Local Government Board to the erection of a hospital for small-pox patients at Gore Farm Estate, Essex, at a cost of 70,000/.

**The South-West Queensferry Caisson** of the Forth Bridge was successfully launched on Monday afternoon. The caisson is 70 feet in diameter, and the total weight is about 200 tons. Its depth, when launched, was 44 feet, and when finished it will be about 55 feet. This is the first of four caissons required for the bridge.

**The Clothworkers' Company** has voted 2,000/ towards the 20,000/ required for the complete equipment of the new Central Institution of the City and Guilds of London Institution. This is in addition to their original building grant of 10,000/ and their annual subscription of 3,000/.

**The Birmingham Architectural Association** on Tuesday evening held the last meeting of the session, under the presidency of Mr. F. E. F. Bailey, when a paper on "Architectural Perspective" was read by Mr. J. King James, illustrated by drawings and sketches. A discussion followed and a vote of thanks to the lecturer, in which Messrs. H. H. McConnal, Victor Scruton, W. H. Kendrick, and Franklin Cross (hon. sec.) joined, concluded the proceedings.

**Messrs. Rownson, Drew & Co.** have secured the contract for the girder work for the City of Exeter Lunatic Asylum, now being built by Mr. Henry Phillips, of that city.

**Messrs. Tancred, Arrol & Co.**, the contractors for the Forth Bridge, have been sued in the Scottish Courts by one of their labourers for damages for injuries alleged to have been received by an iron pillar weighing two tons falling and breaking his leg. The jury have found the defendants liable, on the ground that they failed to have a competent superintendent in charge of the work at the time the accident occurred, and have assessed the damages at 300/ sterling.

**Builders' Benevolent Institution.**—An election of four pensioners on the funds of this institution was held at Willis's Rooms, St. James's, on Thursday last, Mr. Henry G. Smith, president, in the chair. There were eleven candidates for the four vacancies—viz., nine men and two women. The poll was open from two to four p.m. The scrutineers, Messrs. Thomas Stirling and Thos. F. Rider, announced the results of the polling, and the successful candidates were declared to be William Mansell, William Voysey, Thomas Theodore Spradbury, and Lilius Greig. Votes of thanks were accorded to the scrutineers, the vote-takers, and the chairman, and the proceedings terminated.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, MAY 31, 1884.

### TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."

### COMPETITIONS OPEN.

# LINDSAY'S

## IMPROVED PATENT REVERSIBLE TREADS & LANDINGS

### FOR EVERY DESCRIPTION OF STAIRCASE.

**T**HIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

In Hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, not leaving any cracks, so that the treads or landings can be swept or washed quite clean; also, if it be necessary to get light under a Staircase or Landing, rough glass blocks can be fitted in the Iron frames, side by side with the wood, and a subdued light thus obtained.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works,

**13, 14, & 15 SOUTH WHARF, PADDINGTON, LONDON, W.**

# The Architect.

## AN ARCHITECTURAL GUILD FOR THE FUTURE.

ATTENTION has recently been directed to the circumstance that the Institute of Architects is just fifty years old. Perhaps it may have occurred to some of its members and friends that a modest demonstration might have been indulged in to celebrate the event. In fact, now that we think of it, there was a sort of proposal published by authority—such authority as there is—at the time the recent conference of architects was being organised, to the effect that the fiftieth anniversary of the foundation of the guild should be duly taken into account in the programme. But nothing came of this; we cannot tell why; perhaps such a critic as Sir EDMUND BECKETT, ex-honorary associate, might suggest that it has only gone characteristically enough to form one more tessera in the great pavement of good intentions that underlies the world of human action and inaction.

Sir EDMUND BECKETT is a personage of quite sufficient importance in the English architectural sphere to render his resignation of the honorary membership he held in the Institute an occurrence that cannot be ignored. Indeed it is an incident that shows at once the weakness of the Institute and its strength; its strength in so far as it was able to command the allegiance of this gentleman at all, and its weakness in so far as it is not able to retain his homage any longer than he pleases. Sir EDMUND, we are sure, is good-natured enough to excuse us if we say that he belongs most eminently to the class of people who are "kittle cattle to shoe"; and the Institute may well be proud of being able in any way to say it had once shod him, even if it has to confess that he embraced the earliest opportunity of kicking himself free from the encumbrance. But it is only as a sign of the times—coupled, indeed, with a good many others—that we wish to regard the rebuke to which the Institute of Architects has been obliged to submit at the hands of the distinguished, if unruly, amateur. For when he emphasises his attitude by giving his reason for it, he states a case which it would be idle to pretend that the profession could lightly pass by. Sir EDMUND BECKETT does not always weigh his words in a fair balance, especially when he is pleased to utter them with the rough side of his tongue; but, in the present instance, what he alleges only too plainly is only too intelligible to everybody, whether true or not, namely, that the Architectural Guild of England, after fifty years' work, has ceased to represent the advancement of Architecture, through having allowed some other and inferior interest to obtain the command of its resources. And here we may fortunately break away from the challenger if we accept his challenge; in other words, it is not necessary to pursue in any way the personal quarrel, even if it seems to be an unavoidable duty with all who have at heart the highest honour of the architectural profession to inquire how far the accusation which is involved is a serious one. Furthermore, when even admitting this, we need not propose to go into the question of what the Institute is, or has been in the past, so much as to ask our readers to consider for themselves what it ought to be—or something else in its place—for the future. It is enough for us to remember that the architectural world of fifty years ago and the architectural world of to-day are so entirely different as we know them to be.

The condition of the profession of architects in England in this year 1884 is both honourable and prosperous, although no doubt it has its own difficulties to contend with. In numbers it has increased so largely that the professional administration of building, regarded as a luxury of social science, is at the command of every community of moderate importance in the kingdom. To put such a proposition plainly, there is perhaps not a town or district of any consequence in England—and Scotland and Ireland are only a short way behind—but has its architectural business in the hands of men who have been more or less regularly brought up to the work as the pupils of professed architects, and a large proportion of whom have in

fact enjoyed the advantage of study either in London or under London influence. The effect of this is that the business done all over the country has come to acknowledge a high standard of quality. Not only is the task of administration performed with an efficiency which was unattainable by the promoted clerks of works and retired builders who fifty years ago formed so large a proportion of the "architects and surveyors" of ordinary practice, but the act of artistic design itself has become everywhere alike animated by both knowledge and skill, so that it is quite impossible now to draw a line between metropolitan work and provincial, or to recognise any necessity for applying to headquarters because of local deficiencies.

In such circumstances it is plain that we now have a very large body of well-educated men distributed pretty equally over the whole of the country, whose most important interests are bound up together in the welfare of a vocation which every one who has any understanding of it must acknowledge to be singularly well calculated to unite high-minded brethren on ambitious ground. The practice of architecture in fact, as has often been pointed out, combines in a way that is quite unique the exercise of qualities that in other professions are almost at variance with each other. The imaginative designer, the scientific calculator, and the commercial administrator, are all united in the architect; and if this tends in many cases, as no doubt it must, to bring about internal diversities of doctrine and practice, much more must it have the effect, under liberal influences, of creating a broad platform for the cultivation of elevated sentiment and honourable conduct. More especially, when it is borne in mind how grand are the traditions of architecture throughout all the world and all the ages, may such a brotherhood be expected to stand almost quite apart from other bodies of men of business, men of science, and even men of art; and this still more notably in England, as the country which more than any other in this generation represents the combination of the intellectual attributes of mankind on the most practical ground.

To come at once to something like proposals, we may assert without reserve that so peculiar a profession of men as the architects of England must find themselves of necessity associated together in a grand fraternity. Other agencies there may be, and probably in our very free country must be; but the one central agency cannot be dispensed with. Now there are two principles upon which it may be grounded—namely, that of the commercial union and that of the learned society. The union is a combination for united action in the promotion of the interests of the members as against the general public. The learned society is a combination for the simple service of a great public cause on behalf of the country and the world. In theory this distinction is clear enough, but in practice it is even more clear. That the personal interest of the members collectively may be superficially identifiable with the impersonal interest of the cause which their combined action represents, we may admit; but it is when the personal object is the only object that the whole purpose descends to a lower level. The purpose of an English architectural guild ought strictly, and in the first instance exclusively, to be the advancement of architecture—architecture administrative of course, but architecture scientific no less, and architecture artistic most emphatically of all, for this reason if for no other, that art must ever demand the most delicate handling and the most generous deference. That the literature of architecture must take a very prominent place in the whole scheme of enterprise must never be forgotten, although it need scarcely be urged; and that the maintenance of high-minded principles of practice in business should be constantly kept in view is but an inevitable act of grace.

At the same time, even if we were to take leave—as few if any would refuse to allow us to do—to exalt to the utmost this view of the question, it must certainly be acknowledged by all men of business in these business-like times that the practice of the business of an architect ought to be made the bond of a special combination for the promotion of professional interests; and here arises a certain difficulty. We may admit that a considerable proportion of the great body of practising architects must be regarded as having less interest than other brethren in the higher matters of artistic, scientific, and literary work. There must of necessity, therefore, be a "union" in some degree separable from the learned society or "academy." Can these two be one, nevertheless? For our own part we will not attempt to answer this question—at least for the present; but we commend it earnestly to our readers.

One thing we may say : if the "union" is to constitute—as is not unlikely—the basis of the "academy," the leaders of the one interest must not be leaders but followers in the other. Probably the votaries of the purely academical object will never be too much disposed to claim leadership in the union action ; but we are not so sure of the disinterestedness of certain classes of most worthy men of affairs, whose control over either art, science, or literature might be disastrous, but whose surrender of their accidental claims upon such control might be less cheerfully accorded than we could wish.

## ACROSS THE CAMPAGNA.

[FROM A CORRESPONDENT.]

SPRING-TIME in Italy is a joyous season, seldom interrupted by those chilly and disagreeable retractions which often in more northerly climes make the term but a name. When winter takes his flight he goes for good and all, and spring follows in his train heralded by the songs of birds, strewing the way with opening flowers. The hillside is hoary with almond blossoms, a green fringe mantles the expectant branches, the air is limpid, the sky is clear, and the bright sun pours his beams liberally over all. At such times the mind turns naturally to the country. A longing possesses the soul to be in the fields, to bathe in the fresh atmosphere, to escape from busy streets and crowded thoroughfares, vehicles, and houses. Even in Rome, which combines so many of the qualities of town and country, the same longing comes over one, as though it said—"Leave all these ; go to the lakes and mountains ; breathe freely for a few days, and come back refreshed and brighter for the change."

It was in obedience to such a voice that I went recently in company with two friends across the Campagna for a short sojourn to the Lake Bracciano. This lake, with the three or four little towns situated on its shores, is twenty-six miles from Rome in a north-westerly direction. It is comparatively rarely visited by foreigners, as it cannot be taken on the road to any other important place ; and, it must be confessed, is secondary in its claims to many of the sites and towns which lie in the contrary direction from Rome and amongst the Tusculan and Sabine hills. But for that very reason it may have an attraction for those who seek more unhackneyed and less frequented spots. It is said that Sir WALTER SCOTT, when visiting Rome, made this one of the first goals of his journey. It certainly has a romantic interest of its own, though not perhaps deserving such a preference.

Starting out of the Porta del Popolo along the Via Flaminia, the road branches off to the left, and joins the Via Cassia beyond the Milvian Bridge. As the ascent is made up to the table-lands of the Campagna various views of the city present themselves, now emerging into scattered extension, and now hidden by the swelling bluffs. As we enter the open plains of the Campagna, an old sepulchre, without any reason for it, called that of Nero, at the roadside marks the boundary of the visible ruins of old Rome. Little or nothing on this side of the city bears witness to the vitality and opulence of the past. Its monuments, if there were any, have decayed ; its structures, if they existed, have fallen to the dust. Bare, long stretches meet the eye in every direction ; sloping hollows in which the shepherd attends his flocks, or in which peaceful cattle browse lazily.

About nine miles from Rome, La Storta is reached, from which a branch road leads to the site of the ancient city of Veii. The modern hamlet called Isola Farnese, which marks its position, though it only covers a small proportion of the ground it occupied, is built on the volcanic tufa of the district, which is filled with black cinders, as if newly come out of a furnace. It is a miserable place, and the misery was increased at the moment of my visit by a recent fire, which had burnt many of the inhabitants out of house and home.

This would not be the place to dwell upon the history of Veii, the old Etruscan city which played so important a part in the past that it was once seriously deliberated by the Romans, after BRENNAN, the Gaul, had reduced their own city to ruin, if it would not be desirable to transfer its site to that of the ancient Veii. Its legendary history is well known, and the fable of its fall by Roman astuteness and ingenuity. What remains of it is not very much, and every year it is becoming less and less. It is as if nature were jealous of the long rule

of the past that she now makes haste everywhere to hide its monuments and cancel its records, either by the inroads of a new civilisation, or the progressive decay of all traces of the old one.

Still, however, there is something left. The deeply-cut roads which led up to the city, marks of the gateways in the grooves of the rocks at each side, the tunnelled cutting to allow the passage of the stream known as the Ponte Sodo. More important than these is the fine Etruscan tomb opened by CANINA in 1842. The entrance through a narrow passage cut into the rock is guarded by lions carved in stone. It consists of a double chamber, the roof of which is sculptured out of the solid rock, with beam and rafters, supposed to represent the interior of an Etruscan house. The walls are painted with singular grotesque figures, and several painted vessels are left in the tomb as found. When the tomb was opened a human skeleton lay on either side of the doorway, which soon crumbled to dust. One of them wore a helmet, which is still there, pierced by a lance-thrust and gashed with a sword-stroke, wounds which probably caused the death of the wearer. It is thought the other may have been the wife of the warrior, but no name or description was found in the tomb. DENNIS and other archaeological authorities consider this to be the oldest known Etruscan tomb, and think that it may be coeval with the foundation of Rome ; perhaps, indeed, of a still earlier period. Other remains of sepulchres are seen. Some fragments of the walls of the city are still discernible. On the site of the Roman settlement or colony after the subjugation of the city were found the colossal heads of AUGUSTUS and TIBERIUS, now in the Vatican. This site is marked by the ruins of a Roman columbarium. The area of the arx, or citadel, is pointed out, and still retains the traditional name of the Piazza d'Armi, but there is nothing left to indicate it as such. The fine columns which now ornament the Piazza Colonna in Rome were taken from Veii, and may have belonged to the forum or to a temple. Others were used in the building of St. Paul's without the walls.

Leaving the site of this ancient city, its wooded ravines, its heated atmosphere, its dirt and squalor, our journey was prosecuted until we came within sight of a solitary campanile rising desolate and lonely in the Campagna, a little removed from the road. It indicated the deserted town Galera, round which flows the Arrone, an emissary from the Lake of Bracciano.

This little town dates from the eleventh century and was a possession of the ORSINI family. It is supposed to occupy the site of the ancient Roman station Careiæ. It is interesting from its picturesque situation and condition, and remains a monument of the adverse influence of malaria, which caused the inhabitants to abandon it in the early part of the century. It stands on an eminence at the side of a ravine, at the bottom of which the river flows. The desolation of the spot seems to be increased by the continual and monotonous murmur of the waters as they force their way amongst the boulders and broken masonry which choke the bed. The town—or what was once the town—is entered by a gateway, over which are sculptured the ORSINI arms. On the brink of the precipice rises the campanile almost intact. The rest of the town is entirely in ruins ; roofless houses and other buildings, some almost level with the ground, others half hidden in rank vegetation, which grows up luxuriously everywhere. At one of the angles of the town may be seen the stronghold of the ORSINIS, once powerful rulers in this district, built of brick, the masonry still holding firmly together. Many of the walls are overgrown with ivy which hangs from them in funereal plumes. The streets are hardly now distinguishable. The bat hides in the homestead ; the snake and the lizard occupy the threshold. Overhead the falcon soars and wheels, poised on expanded wings, in perfect flight, as if to illustrate the very poetry of motion made without an effort. Some recording sketches furnished us with memorials of this forlorn and desolate spot.

Again our way lay over the bare Campagna, here hardly marked by a tree or hut, until Bracciano made its appearance before us.

Situated on a height, it commands a view of the lake and the surrounding country. The little town is surmounted by a huge castle, whose lofty walls and battlements seem to overburden the town with their dark and solid masonry. The castle was built by the ORSINIS in the fifteenth century. It is constructed on the plan of a pentagon, the longest side of

which faces the town. Two fine towers are connected by a machicolated wall on this side, whilst the side facing the lake is rendered imposing by three other towers of a similar character. It is surrounded by bastions, and has been defended by a moat, the bed of which is now occupied by peaceful orchards, in which flourish the vine and the fig-tree. It is entered by a double gateway. The interior court is now occupied by various erections, which have destroyed its former character. A beautiful outside stone staircase, however, still distinguishes it.\* A carved and painted wooden roof covers this structure, supported by very graceful columns. The interior does not contain anything remarkable beyond a few family pictures, and some wall decorations of no artistic value. It has suffered modern restoration and adaptation, though I believe it is little used by the ODESCALCHI family, to whom it now belongs.

The town itself has not much to interest the visitor, though there are picturesque points to tempt the artist's pencil. The cathedral church is modern, and occupies a commanding situation. Into this church I entered at the hour of Ave Maria. It was occupied by a congregation, chiefly women and children, who were chanting a litany. The scene was a poetic one. The alternation of the voices, the gathering twilight, the glimmering of the candles, and the general air of mystery and devotion, produced a soothing effect on the mind. A raised platform was erected at one side of the aisle for the *Quaresimale*, or Lent sermons, preached at this season. A crucifix was set up beside it, under which was placed a picture of the MADONNA, with two candles burning in front of it. Presently a priest ascended the platform and began his sermon. It was on the duty of confession. After some preliminary remarks, he introduced a story, not, as he said, for the purpose of amusement, but in illustration of his theme. "A missionary," he said, "preaching on this subject, noticed a man in the background who appeared to be much affected with his sermon, so much so that he was weeping violently. When the sermon was ended the preacher went to the man and besought him to make confession of the sins which troubled him, and so obtain pardon through the means of the Church. The man replied that he was not weeping for his sins, but because his ass was dead. 'I loved him,' added the man, 'like a brother, and he had a voice as sweet as your own.'"

"But you," said the preacher, turning seriously to the congregation, whilst a titter pervaded the church, "do not weep because your ass is dead, but weep because your soul within you is dead to the grace of God."

An appeal so familiar and human could hardly fail to make an impression on his hearers.

The town of Bracciano has no ancient history, though it took a busy part in the social and civil broils of the Middle Ages. In the contests of the COLONNAS with the Popes in the fifteenth century it suffered siege and sacking. The lake is a volcanic basin about twenty miles in circumference. This large sheet of water presents a picturesque view to the traveller; it is surrounded with low-lying hills, over which is seen the far Ciminian range with some snow-peaks in the distance. It was the Lacus Sabatinus of the ancients, and appears to have been kept as a huge fishpond artificially stocked with fish. There are two or three little towns on its borders, one of which, Vicarello, I visited, which contains remains of antique times. It was the ancient Aquæ Apollinares, as fixed by M. DESJARDINS from a number of dedicatory inscriptions in honour of APOLLO which were found there. In 1852 a large number of copper coins and some silver vessels, votive offerings, were found in the reservoir belonging to the ancient baths, which are now preserved in the Kircherian Museum in Rome. The hot springs are still in use. Trevignano, another of these small towns on the borders of the lake, has been identified as the site of the Roman station Sabate, from which the lake took its name. There are legends of an ancient city swallowed in its depths, and still fishermen are reported to see at certain seasons walls and towers dimly gleaming through the intervening waters. The volcanic nature of the situation might have rendered such a catastrophe possible.

The winter visitor to Rome might do worse than make this one of his excursions from the city. In the winter, though, it ought to be; for it is said to be anything but healthy in the summer, owing to the prevalence of malaria in the neighbourhood.

## NOTES FROM PARIS.

THE old Gothic church of St.-Merri, in the Rue St.-Martin, is not often visited by tourists. From the earliest days of Christianity in France a church stood on the site, although no part of the present building appears to be older than A.D. 1520. The adjoining buildings have been allowed to encroach upon the church to a remarkable extent, but the porch is visible, and forms a contrast with the plainness of the interior. What with encroachments and neglect, part of the building is unsafe, and money has been voted by the Municipal Council to remove the tower. The groining in some of the chapels is stained with the wet which passes through the roof. The church is worth a visit, as it suggests the battle of the styles. The sanctuary is Renaissance, having been transformed by means of marble casing. On some of the piers the covering has not been carried up for the whole height. The arches in the chancel are on one face elliptical, but in the chancel aisles we can see the original Gothic contours, and can judge of the change which was accomplished by means of slabs of marble.

It is possible that the roofs of other churches would be the better if they were more often inspected. The Panthéon or Church of St. Geneviève is to a great extent a municipal building, and therefore should be in a good condition. But during one of the late thunderstorms the writer observed that the rain found its way through the roof, and in a short time the pavement was wet. There have been settlements in this church which must injure the outer covering, and originally the superstructure was made too heavy. On that account there ought to be an examination of the roof once a month. If the rain enters in one place it may in another and destroy the frescoes. As the secular authorities have so much to do with the church, is it a stroke of policy that allows so much frippery to remain about this building? It may not be generally known that the heavy crimson-and-gold curtains, which envelop the grand altar, are only scene-painters' work, constructed of boards and canvas. The stalls, which at a distance appear to be good examples of joinery, are also sham, being made of the same flimsy materials. The clergy for their own sake ought to take steps to have the drapery and stalls removed, for bare walls and plain chairs being more honest would be more appropriate.

In about a week the lottery for the schools and museum in connection with the Union Centrale des Arts Décoratifs will be closed, and for a fortnight there will be anxiety amongst the millions of ticket-holders, to be followed by the usual disappointments. The prizes vary from 500,000 frs. to 500 frs., and a total sum of two millions of francs will be distributed. It will be said that lotteries do more harm than good, and in France all schemes connected with them are rigorously scrutinized before tickets are allowed to be issued. But after all what is the loss of a franc, and how many art institutions in England would be improved if funds could be obtained so easily? The Decorative Arts Society is worthy of the support of all France. Hitherto it has derived but little aid from the State, and yet the collections in the different departments are of much value from the broker's point of view, while every example is of a kind that is likely to be suggestive to the artist. The hard-working council have done so much and wish to do more, but money is essential, and the lottery is the most eligible way to raise it. Paris no longer has the monopoly of art workmanship; and it is feared that foreign rivals in England, Germany, Italy, and Russia will become stronger, and secure a still larger share of the world's patronage. Hence the anxiety to establish schools and museums which are to be restricted to the application of art to industry.

The existing Museum of the Union would be attractive and profitable to the art student if it contained nothing more than the collection of sketches and studies which have been presented by M. Galland. They represent half a century of work. When an artist has been selected to paint a part of the walls of the Panthéon, he has obtained the blue ribbon of his order, and M. Galland's position is determined when we say that he has been one of the privileged few, and that his pictures will be hereafter compared with those by M. Cabanel, M. Bonnat, M. Laurens, and M. Puvis de Chavannes. In the collection which is in the museum it is possible to trace the steps by which so much greatness has been attained. M. Galland's principle has been to do everything in the best possible way, and if anything he is too fastidious in

\* See Illustration.

judging of his own work. We can see that with sketches of simple things which were made long ago as much care was taken as if they were elaborate engravings. His dissection of plant forms would delight a botanist, and the artist lingers lovingly over a flower until he has discovered its suggestiveness to him as a decorator. A bit of ribbon is twisted into spiral, and becomes a study for contours and light and shade, which requires skill to complete. M. Galland, following the Venetians, delights to make architecture one of the principal features in his decorations. The studies show that every line in his buildings has been determined accurately by rules of perspective. We find, in a word, that a man who was endowed with genius of the highest kind has toiled patiently over details, and in this way a style was formed which is always recognisable, whether the subject is the human figure or conventional ornament, by its beauty and its truth.

An exhibition which is pretty sure to attract crowds has been opened in one of the salons of the Louvre. The sums paid for admission will be applied to technical schools, especially those for metal-workers. The principal attraction is the case containing the Crown jewels, but the exhibition also represents work in various metals, from children's watches which are worth less than a sou to tiaras which have been made for princesses and the wives of American millionaires. It is proposed to sell the Crown diamonds, reserving those which possess an historical interest. They are seen in so many forms—coronets, necklaces, belts, brooches, swords, combs, watches, stars, orders—that the eye becomes dazzled, and it is difficult to realise how much money the contents of the case are supposed to be worth. There is one necklace of pear-shaped pearls of unsurpassed beauty, and a diadem of pearls and diamonds arranged in exquisite style. An epitome of French history would be given if the stones had tongues. One watch was a present to Louis XIV. from the Dey of Algiers; a figure of an elephant was a present from Mazarin to the king. A brooch was remounted four hundred years ago; a belt is a copy of one worn by an actress in a burlesque, and which attracted the ex-Empress. *Vanitas vanitatum!*

The room in the Louvre is not large; the cases of exhibitors are therefore small, and in some cases inadequate in size. A better notion of what is done by Barbedienne in reproducing ancient and modern statues can be gained from gazing at his shop windows. M. Bodart shows some excellent work in hammered iron; there are modérateur lamps well mounted by M. Victor Lacroix, and beautiful enamels by M. Charles Jean. The bronzes, by MM. Thiebaud Frères and Gautherin, hold their own against many rivals. A case is devoted to theatrical jewellery, while near it is one containing deceptive reproductions in plaster, by M. Caussins, of famous works in bronze, silver and ivory, which merits the attention of art schools. There are some cases of valuable jewellery, and it may be worth noting that M. Fouquet has for his ornaments revived the system of employing gold to a great extent in combination with diamonds.

## THE INTERNATIONAL HEALTH EXHIBITION.

WE regret to state that the unpreparedness visible at the opening of the exhibition is still painfully apparent in many instances; and unfortunately this happens to be the case with several of those that we had singled out for our primary descriptive notices. We shall leave our medical and hygienic contemporaries to discuss the relative values of the foods and drinks, of which latter there is a goodly display, from natural waters to rare old port, and to those journals who are supposed to represent "society," the description of the dress both for men and women that is collected in the eastern and western quadrants, and following the catalogue in consecutive order, we shall take the "Dwelling-house" from which to commence our first notices, and so far as circumstances enable us, take the exhibits of note *seriatim*. The class in which the dwelling-house is commenced is XX., and it embraces no less than eleven classes of material objects, without counting that in which the diagrams are shown. Starting in the central gallery, we find Class XX. is devoted to dwellings, models and designs for the same, and specimens of buildings erected in the grounds; fittings and accessories for dwelling-houses, and completely-fitted apartments, and when the latter are finished there will be much of interest to examine.

Messrs. Hayward Tyler & Co.

At Stand 510, eastern annexe, Messrs. HAYWARD TYLER & CO. have a small but comprehensive exhibit of their specialities in sanitary appliances. Cisterns for the prevention of water waste, as connected with closets, have of late attracted considerable attention amongst waterworks engineers, and very many have been introduced for that purpose. We have the large double-box cisterns, more or less complicated, and somewhat bulky and expensive, and in contra-distinction the single box, which possess an advantage on the ground of expense, but have often failed to secure the approval of the water companies from certain peculiarities in their construction. It has been considered advisable to have, if possible, a single-box cistern, in which the water should be shut off as long as the lower valve remains open, without any interference with the ball valve. One of Messrs. Hayward Tyler & Co.'s cisterns exhibited here fulfils this condition, and appears to comply with the requirements of the "powers that be" of a water-waste preventer of simple construction and moderate cost. By Howard's patent (the name of the inventor) arrangement of the admission-valve, there is another valve placed in the water-way before the water reaches the ball-valve. This valve closes with the action of the water, and requires to be held open for any water to reach the latter. When the cistern is at rest an arm from the cast-iron lever presses against this valve and holds it open, enabling the cistern to fill in the usual way, but as soon as this lever is raised, and before the bottom valve opens, the pressure is removed from the admission-valve, closing it and preventing the possibility of any water passing the ball-valve, although it remains open. This cistern has received the approval of the New River Company under their recent stringent regulations, and has been largely used over the area of their supply, and elsewhere. It is made as a syphon cistern for wash-out closets, hoppers, &c., and as one with after-flush for valve-closets, and all others that require a charge to be delivered into the pan after the flush has passed. Many other useful sanitary appliances are also shown, such as their cheap valve-closets, which the firm were, we believe, the first to introduce, and their highly-finished valve-closets, with self-trapping

overflow. The waterworks cocks, ball-valves, &c., made by this firm are well known for their excellent quality, and are not only exhibited at this stand, but figure amongst the selection of such appliances shown by the New River Company. In addition to what we have named there is a good assortment of their plank and deep-well pumps, a speciality with the firm, showing good workmanship and great strength in their details. Several first-class certificates and medals were obtained by them at the late Calcutta Exhibition, and the gold medal for their aerated-water apparatus, shown here in the section devoted to machinery in motion in the western annexe.

Silicated Carbon Filter Co.

At Stand 418 is a collection of filters, sent by the SILICATED CARBON FILTER CO., Battersea. The exhibit comprises some very handsome and ornamental designs, the material of which

they are made, in addition to the ordinary stoneware, being marbled china and porous terra-cotta ware. The principle of these filters is very simple, to which the large and increasing demand for them is no doubt due. The salient feature of all of them is that when they require renewing with filtering medium, it can be done by the user without returning the filter to the maker. The whole of the interior is open for inspection and cleansing, and should any of the loose or working parts of stoneware be broken through accident, they can also be readily replaced for the most trifling sum. The firm make special varieties for army and ambulances, ships, infirmaries, &c., and have been used in many Government expeditions.

*Messrs. Jackson & Graham.*

In the south central gallery, at Stand 378, Messrs. JACKSON & GRAHAM, Oxford Street, have an erection comprising three rooms, embracing bedroom, dressing, and bath-room, all communicating. They have been designed in their entirety for the firm by Mr. R. W. Edis, F.S.A., and one of the features that the architect has had in view has been the economisation of space. A more cosy or comfortable suite of apartments could not easily have been conceived; and, although we have heard it said there is a Continental air about them, there is nevertheless a degree of genuine homeliness about them rarely met with except in well-appointed English rooms. The colour selected is enamel white, consequently washable, and so far complying with sanitary conditions. The end of the bedroom in which the fireplace stands has a wood mantelpiece, with drawers on either side, and over-mantel with cupboards, &c. On the one side of the fireplace is an escritoire, with bookshelves above, and on the other side is a double washstand, fitted for hot and cold water service. As these occupy the entire end of the room, and are all connected, they have the appearance of one piece of furniture. At the opposite end is a handsome wardrobe, with bevelled plate-glass panels; and smaller articles of furniture, arranged with taste, help to make up the appointments. The bedstead, a handsome production in brass, is furnished on the German plan with two small beds; and, although we are aware that to the Teutonic mind generally this is the correct manner in which two persons should sleep in one bed, we very much question if it will ever become popular in England, and we fail to discern any advantages from an hygienic standpoint. On the other hand, we see unpleasant features likely to accrue from this dual bed. A terra-cotta non-arsenical paper covers the walls; the long window-curtains are of cretonne of similar colour, and the short ones of Madras muslin. The windows are prettily constructed, having beaded coloured panes at the top, with ventilation well cared for in the lower parts. An archway without a door, protected by curtains, leads to the dressing-room, in which is a single bed. A somewhat quaint fireplace, with inviting cushioned "settle" seats on either side, and an over-mantel, the centre of which is fitted with a novel arrangement for the electric light, fills up one end of this apartment. Facing the window we find another escritoire with bookshelves, &c., and the necessary lavatory appointments, with hot and cold water, as in the principal room. Leading again from this by a similar curtained archway is the bath-room, the principal appointments having been supplied by Mr. Conolly, of Hampstead Road. Here we find one of those complete baths—containing shower, douche, needle, spray, &c.—that has become a speciality with this firm, and that we believe was originally introduced by the father of the present proprietor, and in a partitioned corner is a water-closet, known as the safety-valve. In this closet the water-seal is always secured, and is flushed from a 1½ inch service pipe. The service of water is so arranged that it can be discharged in any direction best suited for direct access to the house-drains. On opening the seat a lid is thrown backward, and on closing the seat the lid in question returns to its place over the pan, and forms a further security against the admission of noxious odours into the house. One very commendable feature attracted our attention in this suite of rooms, and that was the many handy little cupboards they contain. Although very useful, cupboards are not always the most slightly appendage to a room, but Mr. Edis has by some happy effect managed to make them appear more like ornaments than the usual commonplace additions, and we are quite sure they will be highly appreciated—by the ladies at least.

*Messrs. Shanks & Co.*

No. 929, Messrs. SHANKS & CO., Glasgow and Cannon Street, E.C., are another firm in this section who are also suffering from a very limited space, with a result that their stand is anything but replete, the display being not nearly so attractive as the one they annually make at the Building Exhibition, and which has been a satisfaction to *The Architect* to refer to. The "Eureka" combination bath that we have described more than once in our columns is here shown, fitted in most elaborate and elegant oak cabinet work, with Venetian mirror, the use of which is undoubtedly the acme of luxurious bathing. Other baths here shown that are also deserving of special attention are the "Imperial," in wood enclosure, and the "Universal," similarly enclosed; the patent rolled edge Imperial bath, beautifully enamelled outside as well as inside, and requiring no cabinet work. A new feature is a

needle bath, with fittings complete. It is made entirely of nickel-plated copper tubes, fitted to upright supports, which are intended to be fixed to the floor, say of slate, marble, or glazed tiles. It partakes of the character of the "Eureka," but of course possesses no "plunge," so is more adapted for hydropathic establishments and similar public institutions. The assortment of lavatories shown by this firm is for the reasons we have stated not a very large one, but comprises one or two of very elegant design, complete with cabinet stands. Their recently patented "Reliable" syphon cistern and the "Tubal" wash-out closet are shown in action, and form as efficient a combination as can be desired. Slop sinks, lavatory basins, and a host of bath and general hot-water fittings completes this exhibit.

*Messrs. Hayward Bros. & Eckstein.*

Stand No. 710 is the position allotted to Messrs. HAYWARD BROS. & ECKSTEIN, Union Street, Borough, S.E., and it is satisfactory to note that in the great demand for space they have not, like many other exhibitors, been crowded out, for there is probably no firm who has a more legitimate right to representation in an exhibition having the title of the present one. Their exhibit divides itself into two heads, both of which come under Class XXV. in "The Dwelling" group. The fundamental principles of hygiene are to bring about a state of things that shall make the attainment of good health the normal condition, and not merely to provide or suggest remedial measures for existing evils; though it must be understood we by no means deprecate—rather, we appreciate—the numerous contrivances that have appeared and are constantly coming to the front for the latter object. Messrs. Hayward Bros. & Eckstein are one of the few firms who provide the essential requirements and also the remedial appliances. The semi-prism pavement lights of the firm, here to be seen in their various adaptations, will be at once admitted as fulfilling the first object, by directing daylight into basements and underground apartments where it is an impossibility to make its appearance naturally, thereby obviating the necessity of burning gas or providing other artificial light, and so keeping the air as fresh and cool as possible. Hayward's Sheringham inlet ventilator, and Boyle's mica-flap outlet ventilator, as depicted below, form a simple and effectual

method for purifying the atmosphere, either of private dwelling-rooms or public buildings, by supplying a continuous stream of fresh air and carrying off the vitiated air in the least conscious manner. These ventilators are shown at the stand in a variety of sizes, and are arranged so as to give the visitor as clear an idea as possible of their action.

*Messrs. Candy & Co.*

At 497 Messrs. CANDY & CO., of Newton Abbot, and other addresses, make a good display of sanitary stoneware, facing and ordinary building bricks, architectural terra-cotta, and a new sanitary brick. These various goods, which are shown on their stand in great variety, are all made from the celebrated clay, so rich in silica, that is found in such abundance in the vicinity of their potteries at Chudleigh, Torrington, and Bideford. Manufactured of this fine material, the finished article is of flint-like hardness, semi-vitreous, and non-absorbent, and also having a non-poisonous surface; will retain its freshness and purity of colour for almost any length of time even in the soot-beladen atmosphere of the metropolis, where the architectural terra-cotta is finding an increasing sale. It is on account of these peculiar and estimable qualities that the "Sanitary Brick" owes its appellation and has justly received so much favour; and its advent at the present time, when sound and inexpensive material for the construction of artisans' dwellings and middle-class houses is so much sought after, is particularly fortuitous. It can be had either ornamental or plain, and in the latter make is so cheap that there need be no excuse for using the rubbish that too commonly finds its way into the lower class of buildings. The sanitary goods made by Messrs. Candy, and of which specimens are shown, comprise patent exhaust ventilators and chimney-tops, with improvements for creating a powerful up-draught, patent terminals and blowers for forcing fresh air into sewers, drains, &c., and an assortment of highly-vitreous stoneware, sanitary traps, grease-traps, sewer-ventilators, pipes, junctions, &c.

*Messrs. Rownson, Drew & Co.*

Stand No. 387 is occupied by Messrs. ROWNSON, DREW & CO., who are showing Born's patent improved folding lattice-shutter. The idea is quite a novel one, and affords another and most effectual mode for the better guarding of windows and doors of private houses, offices, shops, &c., where space, security, and ventilation is an object, and at the same time providing an efficient and simple means of protection. It is fixed to the window-frame or doorway from the inside, and consists of two wings of equal size, which, when drawn back, are almost hidden from view. Each wing is composed of a number of perpendicular flat-iron bars, crossed by a number of short horizontal ones, strongly rivetted together and placed equi-distant from one another. To facilitate the opening and closing, the principal perpendicular bars run upon wooden rollers upon the window or door-sill. The lattice is fastened on either side of the window or door to be protected, and is locked and bolted in the centre and at top and bottom. They can be made in various strengths, the bars of those shown being  $\frac{3}{4}$ -inch by  $\frac{1}{4}$ -inch, and as they are sent out bronzed or decorated to harmonise with their surroundings, they are in no respect an eyesore or an obstruction, so that they ought to be very generally adopted, as they are undoubtedly one of the most secure appliances of their kind, and would materially impede the efforts of Mr. William Sikes and his fraternity.

*Messrs. Craven, Dunnill & Co., Limited.*

In the east gallery at No. 844 we find the above-mentioned firm from Jackfield Works, near Ironbridge, Shropshire, a neighbourhood that has been rendered commercially historical and prosperous in more than one industry. The firm have been more successful than many exhibitors, and have secured a wall-space 22 feet by 10 feet, and a ground area 22 feet by 6 feet. On this space is massed perhaps as fine a collection of tiles as were ever collected within the same limits, that is to say, when the object has been to show specimens of each class of the production of a firm. At the right hand top corner of the wall-space is a handsome framework containing artistic moulded and enamelled tiles, each pattern having a bordering of dark purple plush to separate it from its neighbour, a plan to be commended as bringing out the pattern of the tile, and avoiding the confusion often visible when a number of patterns are placed together. These tiles are adapted to most uses, such as the decoration of furniture, mantelpieces, grates, and hearths. A fine dado below this is well worth observation. The rich colour effect is remarkably good. In the centre are inserted moulded figure subjects representing poetry and painting, these parcels being enriched with plain and embossed enamelled tiles. To the left of the frame first mentioned are to be seen others containing specimens of ceramic mosaic patterns of good design and colour. We need scarcely remind our readers that this is a branch of their industry in which, if we were to make a selection, we should say Messrs. CRAVEN, DUNNILL & CO. excelled most, though it is scarcely fair to individualise where all is so meritorious; but the successes they have gained in the laying of this kind of flooring, to which our own columns have borne witness, places them beyond cavil at the very height of this resuscitated art, and it is quite unnecessary here to point out the advantages the ceramic mosaic possesses over the ordinary set pattern of the geometric tile, from an art view. Placed along the lower left hand portion of wall-space are some fine slabs for backs and sides of fireplaces, and immediately in front of them, on the ground floor, are arranged several hearths and kerbs. The tiles used in these collections embrace rough and smooth enamelled tiles, Barbotine, hand-painted decorative and electric tiles, embossed and indented, besides tortoiseshell and enamelled tiles possessing rich effect. A handsome framed panel of hand-painted "Barbotine" tiles forms another subject of interest, and one that may be used for some situations in room decoration. A very interesting feature in this display are some reproductions of ancient tiles truthfully copied, such as were used by the firm in Chester Cathedral, Christ Church Cathedral, Dublin, and St. Patrick's Cathedral in the same city, as well as in other noted ecclesiastical edifices in the kingdom. Although there are a large number of other tiles in this exhibit, they are in the main replicas of what we have already described so far as their especial uses are concerned, and it now only remains to us to compliment the firm on the general *ensemble* of their display.

*Mr. W. B. Howell.*

At Stand 381 is an assortment of wicker furniture contributed by Mr. W. B. HOWELL, of Norwich. It comprises the usual things made in this ware, as lounges, tea and work tables, and various easy and other chairs. Considerable taste is shown in the design of some of the latter articles, and the manufacturer has certainly succeeded in treating this material, which it is obvious is difficult to render very artistically, in a manner superior to what is generally seen; and instead of being, as is often the case, an eyesore to a well-furnished room, some of the above would, on the contrary, be an improvement.

*(To be continued.)*

## EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the closing sessional meeting of this Society a paper was read by the president, Mr. MacGibbon, on "Scotch Castles and Houses of the Fifteenth, Sixteenth, and Seventeenth Centuries." After brief allusion to the castles of the fourteenth and fifteenth centuries, he said that at the beginning of the fifteenth century a new style of castle building was introduced, which consisted of buildings surrounding a courtyard, such as Doune and Tantallan. The palaces at Stirling and Linlithgow were well-known examples. During this period, and, in fact, until the eighteenth century, castles and houses continued to be built on the model of the quadrilateral keep, as in the previous period, but with certain modifications which showed their later date. Many of the older keeps were also enlarged into castles with quadrangles after the new style, as at Craigmillar, Crichton, &c. About the middle of the sixteenth century several circumstances concurred to cause a change in the style of domestic architecture. The nobles, enriched by the acquisition of church lands, desired more commodious dwellings. The use of gunpowder rendered the old defences useless, and thus caused them to be abandoned; so that the mansions now built partook more of the nature of domestic than of military architecture. The comparatively quiet reign of James VI. gave scope for housebuilding, while the closer connection with England helped to introduce many new features, both in the arrangement of the plans for providing improved accommodation, and in the style of ornament, which now began to assume the character of the Renaissance. These combined causes led to a new style, which forms the fourth period of Scotch domestic architecture, extending from the middle of the sixteenth century till the complete introduction of the Renaissance, towards the middle of the seventeenth century. During this period the plans both of the tower-built and quadrangle-built castles continued to be on the same general lines as before, but with certain modifications and improvements; but the external architecture was quite changed. Such buildings as Crathes, Castle Fraser, Glamis, Claypotts, Elcho, Craigneur, &c., are well-known examples of this well-marked style. This style is frequently regarded as "French," but the lecturer proceeded to show that this was a mistake, and that the style was of native growth and development. Several of the more important castles were described, showing the improved accommodation latterly introduced, Dunnottar being specially referred to as comprising in one example a collection of the various styles of building employed from the fifteenth to the eighteenth century. After the turrets disappeared, the Scotch style began to yield more and more to the Renaissance influence, although long retaining many of its native features. A tendency to symmetry in the arrangement of the elevations and plans, and the introduction of features clearly borrowed from England, as at Winton House, Heriot's Hospital, Argyle's Lodging, Stirling, &c., soon led the way to the completed Classic works of Sir Wm. Bruce at Holyrood, Kinross, &c.; and the native architecture of Scotland was lost in the all-embracing Renaissance. The lecture was fully illustrated with measured plans and original sketches.

## MR. RICHMOND ON ART.

PROFESSOR RICHMOND made the following remarks in proposing the toast of prosperity to the Birmingham Art School at the luncheon which followed the laying of the inscription-stone. He said that the gentleman who in all probability would have occupied the position in which he now stood had been removed from amongst them, and it must be a matter of regret to them all that he was not present on that occasion. From all he had heard of his character, Mr. Chamberlain must have been one of the most benevolent and charming of men; and standing there in his place he felt but a feeble substitute for him. He would like to have said something about those two munificent gentlemen who had done such honour to Birmingham and such honour to themselves; but all this had been said, and all that was left for him to do was to bring a message from his fellow painters—a message of encouragement to the town of Birmingham and to the School of Art, and a message of confidence that both would fulfil their trust. It appeared to him that the subject of art was very constantly misunderstood; that it was looked upon as an extra in human life, and that it was not sufficiently thought of as a necessity belonging to it. There was no reason why commerce and art should not go hand in hand; and, as he stood there in this great centre of England, and as he was reminded by these gentlemen's munificence of the great days of Venice, of the great days of Genoa, of the great days of Florence, he could put himself back into the position of the early painters, and feel, as they must have felt towards those merchant princes, a gratitude to these gentlemen. Touching upon the detail of the school's work, Professor Richmond said he had learned that there was to be a collection of casts made, and that these were to form some sort of archaeological museum. He had given a great deal of attention to the study of sculpture, and he thought the success of their efforts very much depended upon the

class of work that they chose as examples. Necessarily it would be difficult for them to have a very large collection at first, and he would advise them to take as a beginning only those representative fields of Greek art which were the best understood, and the simplest in their structure and nature. If the gentlemen who were interested in that matter would go to his university—that of Oxford—or to Professor Colvin's university at Cambridge, they would there see two small museums founded, as he thought, upon the exact lines which it was desirable to follow in Birmingham. With regard to the teaching in the School of Art of Birmingham, he needed to say nothing beyond this—that when it was his privilege last February to deliver at the Midland Institute an address to the students, and when previously to that he had looked over all the drawings made for competition to be sent up to South Kensington, he was made aware of the fact that the soil in which they were planting their tree of art in Birmingham was a soil worthy of the labour. They had a magnificent set of pupils, full of intelligence, full of vigour, and without any sign of what so often came into a state of civilisation in a large town—over-luxurious sentiment. It was out of that sort of stuff that the art of all great nations had grown. Art had invariably come out of the lower middle-classes, if he might so say. They were strong and healthy, both in mind and body, and the tendency of their minds was to view things from a healthy and strong point of view; and it was out of this that true feeling came, and out of the reverse that false sentiment was born. He wished to make one remark with regard to the study of art. True art was not copying, but the interpretation of nature. We all saw differently. The true artist was the man who saw most beautifully, and who, as it were, was the prophet of nature, and who by the strength of his vision obliged others to see what he had seen. And this he saw not only with his outward eyes, but with his inward poetic sense, if he might strain the point so far. We all, to use an illustration, saw four ruts in a road where carriages had passed, but it occurred to the poet's and to the artist's mind—perhaps these ruts have been made one by the carriage that is carrying a child to the christening, and another by the carrying of the child to the tomb. It was with this spirit that one should approach art—the spirit of idealism in realism; and he thought that, as a rule, not enough was made of this. We were often led to regard pictures as merely so much form and colour placed upon the canvas, without any association with the theme which they meant to represent. Be that theme ideal, or be it real, it must express something, and it was only by the highest kind of education in art matters that the student would be enabled to express any abstract ideas or to personify any poetical impressions. For the highest form of art the education must be the most strenuous, and indeed it might be said that only those who had learned to realise to perfection could idealise to perfection. In conclusion, it remained for him to wish them prosperity in that great undertaking, to congratulate Birmingham upon the gentlemen who had been so good to it, to congratulate Birmingham also upon its constant love for education and the advancement of its people, and to remind it that there was a light breaking on the horizon of art, which must before long burst into the splendour of a sunny noon.

### OLD ROMAN VILLAS.

THE old Roman villa lately discovered at Woolstone, on the Craven estate, in the vicinity of the "White Horse" Hill, was recently visited by the members of the Oxford Architectural Society. The excavations cover a considerable part of the field; the foundations of the walls are clearly visible, and the principal apartments of the villa identified by the tessellated pavements of beautiful geometrical design with which the rooms are laid. Mr. Parker produced a ground plan of the villa, together with some well executed illustrations of the pavements. A passage of great length, and some minor parts of the villa, had been laid with red tesserae of a commoner description, such as may be seen at Silchester and other places.

Mr. James Parker made some remarks, in the course of which he said that they were assembled on the site of an interesting Roman villa. He was perhaps speaking to some who had not seen more than one or two such villas, while some, probably, had not seen one before. If, however, they had seen three or four such villas they might see a fifth that would differ from the previous ones, as the Roman houses were arranged on different plans, pretty much as were the modern villas that were built in the neighbouring towns. Still, there were certain things common to all of them. It was rather awkward bringing this point in at once, with respect to this particular villa, because, so far as the excavations had gone, one of the things commonly found in Roman villas was conspicuous by its absence. He referred to the hypocaust chamber, beneath which were arrangements of hot-air flues, intended to warm the chamber above, as well, probably, as other parts of the villa. No such chamber had been brought to light in this instance. In the Roman villa at Wheatley the chief part of the hypocaust was found existing, but after the lapse of a day or so, nothing of the hypocaust was to be seen. However, after a good deal of searching throughout the village the missing tiles

were found and brought back to the original spot, and the hypocaust was reconstructed. These hypocausts were connected with chambers that were evidently used as bath-rooms, and they illustrated this circumstance, that when the Romans left their own homes to occupy England, they brought their Roman habits and customs with them. One of the habits of the Romans was to keep themselves warm; they were accustomed to warmth from the nature of their own Italian sky, and when they came to England they found the sky and the weather very different to what they had experienced, and, therefore, one of the first things to do after they had settled themselves down in this country was to construct these warm chambers in their dwellings. Another great feature in these Roman villas was that one of the principal chambers was usually laid with tessellated pavements of an ornamental character, similar to that which they now saw before them. They had evidently found the large room in this villa, but to his mind the most interesting part of the discovery was the little recess which had been disclosed on the southern side of the great passages which ran from east to west. That part was probably 100 feet long at least, and about 8 feet wide, and it was tiled in different places after a different manner. On the south side of the passage was this little recess, perhaps about 14 feet long, and 5 feet or 6 feet wide. What would this chamber be used for? He thought it most probable that it was in this chamber that the household gods were placed, and that this small apartment was looked upon with a certain amount of respect, and was, possibly, more or less connected with religious uses. In this particular instance they found a tessellated pavement of even a handsomer pattern in the recess referred to than was laid in the larger apartment. With the exception of the pavement at North Lye, this was, perhaps, the finest piece of tessellated work that had been found in this district. They might well ask how came it that these Roman villas were found dotted about the country? Not very long ago a Roman villa was found at Frilford. Compared with this, the villa at Frilford was in some respects more interesting, while in other respects it was less interesting. At Frilford the walls were clearly shown, being constructed of stone, and standing in a field of earth and sand. Here the walls were composed of masses of clunched chalk, the field being full of loose chalk. The walls having been thrown down and mixed with the chalky soil of the field, it was very difficult to get out a clear line of demarcation. The question arose, were there any more of these Roman villas in this neighbourhood? There was one near Wantage, and he well remembered Mr. Davey's description of it. The tessellated pavement in that instance was not nearly so fine in pattern as in this villa. It might be asked what did it mean by finding here and there odd Roman villas stationed at distances of seven or eight miles apart? They might compare the Roman occupation of England to something like the British occupation of India. There must have been stations at about even distances apart from each other, near the roads, and sufficiently close to each other, and to a Roman cohort, to be able to communicate and put down any sudden rising. The Roman officers in all probability lived in these villas that were scattered over the country, and under their control and supervision the conquered British were kept in subjection. Then came another curious question: Why was there not a single Roman villa found with the walls above the surface of the ground? One or two reasons for this might be assigned, but the chief reason appeared to him to be this, that when the Saxon hordes came from the south, they seemed to have devastated the country wherever they went, and that what they could not pull down they burnt. They had a striking example of this fact at Silchester, where a great mass of burnt material was met with. In this instance, they had to solve a difficult problem, which had not presented itself in connection with other Roman villas that had been disclosed.

### SCHOOL OF PAINTING IN WATER-COLOURS.

THE first season of the Free Schools of the Royal Institute of Painters in Water-Colours came to a termination on Saturday, when the prizes were distributed to the successful students by the president, Mr. James D. Linton, in the presence of the Council and members of the Royal Institute. In the course of his address, Mr. Linton remarked on the rapid strides made of late years in the art of water-colour painting—an art in which England stood pre-eminent—and pointed out the great advantages the students of the present day possessed over their predecessors. With regard to the oft-quoted remark that it was better to go to Nature than to a teacher, he said that nothing could be more fallacious than such a statement. In the greatest age of art—the Renaissance of art in Italy—students were apprenticed to art the same as to a trade. While complimenting the students of the Institute on the great progress they had made, he urged them to still further exertions during the next season. The prizes were then distributed, the principal prize-winners being Mr. C. J. Fox for figure, and Mr. A. C. Wyatt for landscape. The schools will reopen the first Monday in October.

## NOTES AND COMMENTS.

THE annual congress of French architects will be held in Paris during next week. The proceedings commence on Monday and end on Saturday. As usual papers will be read, and there will be visits to works which are in progress. Among the buildings to be examined are the great church at Montmartre, which is yet far from completion, and the Lycée Jeanson. The sewers are also to be visited, and as compensation there will be an excursion to the Château de Blois. Arrangements will be made for a visit to some manufactory of stained glass in Paris.

THE opening of Wolverhampton Art Gallery on Friday in last week received additional interest from the fact that the anonymous donor of this handsome present to the town consented to his name being at last made public, and Sir RUPERT KETTLE announced that they were indebted to the generosity of Mr. PHILIP HORSMAN (Messrs. HORSMAN & Co., builders), of Wolverhampton. Mr. HORSMAN's account of how he came to build the gallery is this:—"To the rector, I believe, I am indebted for the inspiration to present the gallery. At the opening of the park it was he who suggested that an art gallery was the next thing for the town, and whoever would present it would be its benefactor. For some time previous to this it had occurred to me as a duty to use what I may term my surplus means for the benefit of my less fortunate neighbours. I have considered several schemes, but could not bring my mind to decide what was best for me to do. When the art gallery was mentioned I turned it over in my mind, and I distinctly saw what my duty was, and I made up my mind to set about the work."

A PRIVATE meeting of delegates representing the various Parisian art industries was held in Paris on Thursday to consider the law as it relates to trade societies. Among the trades invited were the carpenters, modellers, turners, tapestry weavers, carvers, painters, metal-workers, and joiners. It is proposed to form a central council to deliberate on questions in which unity is desirable. Many of the trades at the present time are suffering, partly from the depression which apparently is universal, and partly from foreign competition and new arrangements for the division of labour. It is surprising what low wages are often received in Paris by clever workmen, and it is not surprising if it should be supposed that a remedy for their evils would be found in more perfect organisation.

THE Darlington School Board have received in competition eleven designs for some proposed new schools in Beaumont Street, and at a meeting of the Board, held on Thursday week, the General Purposes Committee's report was read, recommending the selection of plans marked "Three R's," by Messrs. CLARK & MOSCROP, of Darlington. After some discussion, however, the majority of the Board decided to adopt the design marked "Hope," as being the cheapest to carry out. On opening the letters of the competing architects, the author of the selected design was found to be Mr. F. W. BROOKS, of Darlington. Mr. H. BROOKS, father of the successful competitor, a member of the School Board, formed one of the majority who voted for "Hope." It is not to be presumed that Mr. BROOKS, sen., had the slightest idea as to the authorship of the designs by "Hope," but the incident will doubtless add another sore to the inevitable heartburnings of the competition system.

THE majority of the eighty-two designs for the GAMBETTA memorial are suggestive of the evil which is inherent in the competition system. If some of the competitors, such as MM. DALOU, COUTAN, FALGUIÈRE, ETEX, LEMAIRE, BARTHOLDI (and many other names could be given), were offered a commission, there is little doubt that a memorable work would be created. Repose is one of the first essentials in sculpture, and it is almost impossible to attain that quality when an artist feels that his design will have to contend with others which appeal to the admiration of the mob. It must be said that the majority of the competitors have not done justice to themselves, or to the subject. GAMBETTA was a great man, but it is hardly fair to suggest that he was the greatest of Frenchmen, nor is it worthy that the building of the Palais du Corps Législatif should be dwarfed by a memorial which would make the statues of *Pro-*

*dence* and *Justice* look like puppets, while COLBERT and D'AGUESSEAU would become insignificant. It may be necessary in the interest of a party to deify GAMBETTA; but it is a pity that art has been made a tool in the process. GAMBETTA had a fine head, but his body resembled that of the normal Paris shopkeeper. It is, therefore, difficult to make an heroic figure of him. In most of the designs he is seen in an attitude that suggests one of his impassioned appeals; in many he clasps the national flag, and some suggest that he performed a feat like NAPOLEON's at the Bridge of Arcole. One artist has a tall column with a bust on the top, and nude figures struggling below. A second shows a statue in a summer-house, and an honest mechanic has sent a model which consists of a water tower, painted with stars, and supported by columns that would carry a reservoir. In another design, which is well worked out, GAMBETTA stands on a shield, which is carried by men representing various classes of the population. Several of the designs have allegorical figures, and in one we see France in danger of falling backwards if it were not for the support of little Cupids. The best designs are those in which architecture has been combined with sculpture, for in them the extravagance of the sculptor is overpowered by the structural lines, and, taken as a whole, the competition is more satisfactory as a test of architectural skill than of sculptural design. The jury elected by the competitors consists of MM. GARNIER and BAILLY, architects, with MM. CHAPU, DUBOIS, and GUILLAUME, sculptors.

THE British Museum authorities, who have been devoting their attention of late to the rearrangement of the Oriental department, have now thrown open a room, that leading to the Assyrian basement, which is devoted to Semitic inscriptions. The interest with which the French Government has taken up this branch of Oriental archaeology induced the authorities of the British Museum to give greater publicity to the fine series of Phœnician, Hebrew, Himyritic, and Aramean inscriptions which have been too long hidden in the vaults of the Museum. The series of inscribed monuments ranges from the tenth century before to the thirteenth century after the Christian era. Casts have also been obtained from continental museums and other sources. The earliest monument is a fine cast of the Moabite stone, as restored by M. GANNEAU. Above the doorway a cast of the earliest Hebrew inscription, that from the conduit of the Pool of Siloam, will be placed. Two cases are occupied by the inscriptions from Carthage obtained by Mr. DAVIS from 1856-58. These inscriptions belong to the later Punic age. In the centre of the room is a marble sarcophagus.

IT might be supposed that after a month the Salon should lose some of its novelty for sightseers. But on last Sunday no less than 34,700 people took advantage of the rule which allows of gratuitous admission in the afternoons of Sundays. On that morning 1,058 people paid a franc for admission. The attendance in the mornings of week-days when the charge is two francs is rarely numerous, but from 2 p.m. until 6 p.m. the Salon continues to be crowded.

ACCORDING to the latest returns, the number of dwellings in France is 8,875,267. During the past year about 124,000 houses have been erected, and the demolitions have amounted to 88,500. It is generally considered that the building trade is not at present in a prosperous condition in France.

GAS BILLS are a puzzle to many persons from the persistency with which the number of feet of gas consumed increases in the face of economy. Mr. DEACON, of Streatham Hill, has just made some very sensible suggestions which, if put in practice, will secure consumers from having to pay for more gas than has been actually burnt. He says:—"See that the burner is of the size required. All sizes of BRAY's burners can be bought for about a halfpenny each, and any householder can fix them, as they simply screw into the fitting. Have a regulator fixed on the outlet pipe close to the meter; this will prevent the gas being forced through the burners quicker than it can be consumed, and, moreover, insures a steady, uniform light. Where possible, have the old meter removed and a new dry meter of your own fixed in its place. On the index of this will be found a dial showing single feet up to 5. By turning the main tap on while all the burners are off and watching this dial anyone can detect leakage.

HOUSE FOR MR. ALBERT GOODE, MOSELEY, NEAR BIRMINGHAM.

THIS house was built early in last year in the Oxford Road, Moseley, and although on a small scale, possesses nearly every convenience that is usually found in modern houses of a much more pretentious description. The walls are built of red brick, with a  $\frac{3}{4}$ -inch cavity, filled with hygean rock asphalte. The roofs are tiled. The cost was 1,700*l*. Mr. JETHRO A. COSSINS, of Birmingham, was the architect.

COTTAGE RESIDENCE FOR MRS. HOLLIS, MOSELEY, BIRMINGHAM.

THIS small house occupies a charming site overlooking the Bromsgrove and Clent Hills. It has been very substantially built to enable it to resist the violent westerly winds to which it is much exposed, and has hollow walls externally. The cost, including a great length of boundary wall, was about 1,600*l*. Mr. JETHRO A. COSSINS, of Birmingham, was the architect.

STAIRCASE AT BRACCIANO.

THE staircase shown in the illustration is referred to in the article entitled "Across the Campagna," which is published this week.

MANTELPiece AND ROOM DECORATION.

THIS illustration is a reproduction of a design by Mr. E. GABRIEL, architect.

STREET VIEW IN LAHORE, AND DOORWAY.

THE Indian buildings shown are sketched by Mr. KIPLING, who has been exceptionally successful in conducting some of the art schools in India. The geometrical drawing will, apart from the interest of the subject, suggest the care with which Indian artists represent the smallest details.

## THE ARCHITECTURAL ASSOCIATION.

THE last ordinary meeting of the session was held on Friday evening, the 30th ult., Mr. Cole A. Adams, president, in the chair. The annual dinner, it was announced, would take place at the Holborn Restaurant. The following gentlemen were elected members:—Messrs. W. F. Good, J. A. Ashton, and A. W. Cleaver. Mr. C. R. Pink then read a paper, entitled "Notes on Heraldry," which will be found on another page. On the termination of the paper a discussion ensued, in which Messrs. Stannus, Gotch, and Appleton took part. A vote of thanks was passed to Mr. Pink, who acknowledged the compliment, and replied to the various points raised in the discussion.

## Elections for 1884-85.

The list of officers elected to serve during the ensuing session was then read, as follows:—

*President.*—Mr. Cole A. Adams.*Vice-Presidents.*—Mr. C. R. Pink and Mr. W. H. Pratt.*Committee.*—Messrs. Baggallay, Eales, Gale, Garratt, Gotch, Millard, A. B. Pite, Stannus, Stokes, and Turner.*Hon. Treasurer.*—Mr. J. Douglass Mathews.*Assistant-Treasurer.*—Mr. Pratt.*Librarian.*—Mr. R. L. Cox.*Secretaries.*—Messrs. W. H. Atkin Berry and H. D. Appleton.*Solicitor.*—Francis Truefitt.*Assistant-Librarians.*—Messrs. W. Burrell and J. Shelley Birch.*Auditors.*—Messrs. G. A. Pryce, Cuxon, and H. York.*Registrar.*—Mr. T. H. Watson.*Collector.*—Mr. Alfred Hill.

## ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.

AT a meeting of the Council of the Royal Institute of the Architects of Ireland, held in Dublin, and specially summoned to consider the project for the proposed loop line junction railway, the following resolutions were unanimously adopted:—

1. That the President and Council protest in the strongest manner against the needless and unreasonable disfigurement of the admittedly finest architectural effect in the city of Dublin, of which the Custom-House, the grand monumental work of James Gandon, is the principal feature.

2. That, as a practical scheme, architects of experience in the city of Dublin will unanimously condemn the injudicious interference with the ground property of an extensive area as proposed, by a railway crossing several thoroughfares at a shew line, which is manifestly capable of reasonable modification by a shorter and less costly course.

3. That the Institute is by no means opposed to the connection of the railways of Dublin by a reasonably designed loop line, but, on the contrary, is of opinion that such a line is of vital importance to the progress and prosperity of the city. It is of opinion, however, that it should cross the river to the eastward of the Custom-House, and that the sacrifice of berthage to the westward should not be weighed against such a line in comparison with the serious disfigurement of the city now contemplated; and further, that the elevated portion of the swivel bridge, now recognised as also an uncalled-for disfigurement, should be removed at the earliest possible opportunity.

## STUDY OF DRAWING IN ELEMENTARY SCHOOLS.

IN reference to the subject of drawing, the Royal Commissioners on Technical Instruction in their report call attention to the extraordinary efforts which are being made abroad for instruction in art, more especially as applied to industrial and decorative purposes, and to the important influence of this instruction in furnishing employment for artisans on the Continent. Without depreciating what has been done in this direction by the schools and classes under the auspices of the Science and Art Department in this country, and whilst fully alive to the importance of the organisation which tends to the diffusion of art instruction over a wide area, the Commissioners say they cannot conceal from themselves the fact that their influence on industrial art in this country is far from being so great as that of similar schools abroad. This is due, no doubt, to some extent to the want of proper and sufficient preparation on the part of the students, owing to the inadequate instruction they have received in drawing in the elementary schools.

The Commissioners say:—We are aware that the number of children who are supposed to learn drawing in elementary schools is considerable, but it is small compared with the total number in attendance, and it is, we have reason to believe, diminishing. We have ascertained by inspection that the instruction is in far too many cases of little value. Instead of a mass of inferior drawings being sent up once a year to South Kensington for examination there, it is necessary that the instruction in drawing in elementary schools should be as carefully supervised on the spot by the Whitehall inspectors as is that in other branches of primary education. In nearly all the places abroad which your Commissioners have visited they have found that drawing is an obligatory subject of instruction in the primary school, and that it is regarded as of equal importance with writing. The number of hours which the children devote to lessons in drawing abroad is frequently as many as three per week, whereas in England the subject is not only not obligatory, but in about three-fourths of our elementary schools no instruction whatever is given in this subject, and in those schools in which drawing is taught the time devoted to it rarely exceeds one hour per week, and even that not always regularly. This want of attention, together with the absence of competent teachers, proper models and methods, and adequate inspection, fully accounts for the inferiority to which we have referred. The training of teachers for the Irish national schools includes special instruction in drawing, and a grant for drawing is made to primary schools in Ireland by the Commissioners of National Education. The drawing in some of the schools of the Christian Brothers, and in some of those under the Board of Intermediate Education, is good.

We are of opinion that sound instruction in the rudiments of drawing should be incorporated with writing in all primary schools, both for girls and boys, by which also, according to the experience of competent authorities, the writing would be much improved. Something in this direction has already been done in many good infant schools, where children of the age of six draw triangles, squares, oblongs, &c., on their slates. This exercise is repeated on the day of inspection, and is taken into account in estimating the value attached to "appropriate occupations."

We have observed with satisfaction the recent circular of August 1883, prescribing the new exercise of drawing to scale. We believe the principle therein laid down to be excellent, and we trust that the school managers and teachers will avail themselves of the advantages offered to them in this alteration in the first grade work. The permission recently accorded to teachers to give instruction in drawing and modelling to the children of the elementary schools, out of the ordinary school hours, is also likely to prove very advantageous.

We are of opinion that more attention than has hitherto been devoted to it should be directed to the subject of modelling in the elementary school. We notice that by a recent addition to the Art Directory small classes in modelling may now claim a local

examination; we believe this to be a most salutary regulation. Modelling is an exercise of great importance to the future workman, and its rudiments can well be taken up, as in Continental schools, at the earliest age.

Assuming such preparation in the infant and elementary school as we have here suggested, the progress of subsequent instruction in art classes would be immeasurably more rapid. Whether the attendance in any given locality will ever be so great in this country, where the instruction has to be paid for, as in France, Belgium, and elsewhere, where it is gratuitous, is a matter for grave doubt. However this may be, there are two points in connection with the instruction in art schools and classes as bearing on industrial pursuits, which require careful attention. The first is one which we are glad to perceive is now fully appreciated by the Science and Art Department, viz., the advantage of substituting practice in rapid, but correct, execution, in place of the method of stippling, which was formerly not sufficiently discouraged in art schools and classes; greater attention also than hitherto should be given to modelling. The second point relates to industrial designing. This, for a variety of reasons, the chief of which are the want of sufficient knowledge of manufactures on the part of the art teachers, and the absence of sympathy evinced by the proprietors of industrial works, has, with some notable exceptions, not received sufficient attention in our art schools and classes. In fact, there has been a great departure in this respect from the intention with which the "Schools of Design" were originally founded, viz., "the practical application of (a knowledge of) ornamental art to the improvement of manufactures." Large grants of public money for teaching art to artisans in such classes can scarcely be justified on any other ground than its industrial utility.

On the subject of the teaching of industrial design, we are of opinion that the Science and Art Department may with advantage depart from their principle, as at first laid down, of granting encouragement to design only, so far as to award grants for specimens of applied art-workmanship in the materials themselves, as a test of the applicability of the design and as a reward for success in overcoming the technical difficulties of the manufacture. It seems scarcely fair that well-executed art-work by a student, say a richly chased piece of silver plate, should obtain only the same recompense as the design for the same object on paper. We are aware that special vigilance would in this case be required in order to prevent the use of such rewards for trade or for other than educational purposes.

It appears from the evidence, and from a remarkable letter from M. Willms, the eminent designer of Birmingham, that it would be well if persons practically acquainted with the application of design to industrial manufactures were more extensively consulted in the award of prizes for industrial design. We are aware that this is now done in some measure, but, however eminent may be the gentleman whom the department has been in the habit of consulting, it is unlikely that the small number of these should be sufficiently familiar with the vast varieties of "applications" to have the special knowledge requisite for judges in the large number of trades in which design forms an important element.

### HOUSE OF THE VESTALS AT ROME.

THE treasure, in the form of sculpture and inscriptions, found in the course of the excavations in the House of the Vestals has, says the Rome correspondent of the *Times*, been altogether unprecedented. The records of the Roman excavations that have come down to us, from the earliest left by Aldroandi and Flaminius Vacca, may be searched in vain for any parallel instance. It is the first time, however, that anything like a sculpture gallery has been discovered, for the Atrium Vestæ, peopled as it must have been with statues of the Grand Vestals, may fairly be considered in that light.

As the works of excavation were continued along the south-west portico of the atrium from the point marked "W" in the annexed plan, no fewer than 16 marble statues in different states of preservation, and eight pedestals of statues, were found within very short distances of each other—in fact, some of them quite close together; and lying among them large fragments of broken columns, pieces of architectural detail, and innumerable bits of wall panelling of various coloured marbles. For more than a fortnight each day's work generally ended with the sight of the head or the feet of another statue, the base of a column, or the corner of a pedestal, projecting from the bank side of the accumulation, to be completely disinterred the next morning. Counting some distinct fragments of statues and the five pedestals found previous to the clearing of this south-west side of the atrium, the total results are 21 statues and remains of statues, and 13 pedestals, 12 with inscriptions and one with the inscription entirely erased. But, alas! there have also been found within and among the remains of the house and its atrium no fewer than four limekilns. They tell a fearful tale of art massacre, which was probably arrested at the spot where the last of these kilns was cut through, at the height of about three mètres above the level of the atrium, close

to where the statues of Vestals were lying huddled together, and they add further to the abundant proof already possessed that thousands of priceless works of sculpture which adorned the ancient city perished in this way to provide lime for the builders of Mediæval Rome. They fully account also for the complete nudity of the north-east side of the atrium. Of the marble slabs which formed its pavement and panelled its walls, of the many columns that extended along it, or of the statues and their pedestals that stood within it, nothing was found remaining but two or three small fragments of columns of breccia corallina, the cushions, or foundation-stones, flush with the ground, on which the columns of the portico stood, and the three pedestals first discovered at "A" on the plan, which had been used in the building of some later edifice at the north extremity of the atrium, close under the Church of Santa Maria Liberatrice. It must have been in the spoliation of this side of the atrium that the fourteen pedestals of statues, of which the inscriptions were preserved and are registered, together with those of three others found elsewhere, in the "Corpus Inscriptionum Latinarum," were dug out in the fifteenth and sixteenth centuries. Adding to them the thirteen disinterred since these excavations were begun makes thirty, independent of the many more which, like the statues on that side of the atrium and in other parts of the house, have been utilised for lime, or, like the stones of the Colosseum, for building purposes.

The fourth of these pedestals was discovered at the extreme southern end of the south-east side of the atrium, standing against the front of the house, at the point marked "D" on the plan, and the fifth at "W" after the works had been carried a short distance

along the south-west side. These, and some fragments of sculpture in the general mass of accumulation, were all that was found until comparatively virgin ground was reached a little further on, and from the statues and pedestals discovered there one can well judge what a wealth of art the atrium must have contained, and what a veritable sculpture gallery it must have been.

The first of the thirteen pedestals found was in honour of a Grand Vestal, named Flavia Publicia, and was placed on the 5th of the Ides of July, when an Augustus and a Cæsar, whose names had been erased, were Consuls together; the second was dedicated in the year A.D. 364 to a Grand Vestal, whose name had been erased; the third was in honour of another Grand Vestal named Coelia Claudiana, but bearing no date. The "Corpus Inscriptionum Latinarum" contains, however, the inscriptions of six other pedestals dedicated to this Vestal, and one of them shows that the twenty years and more during which she filled the office of Vestalis Maxima included that of A.D. 286. The names of the Consuls erased from the pedestal of Flavia Publicia's statue were undoubtedly those of Philip Augustus and his son Philip Cæsar, who were Consuls together in the year A.D. 247. They could not have been those of Valerianus and Gallienus, for the reason that they

were both Augusti, and this inscription treats of a Consulship held by an Augustus and a Cæsar. Moreover, the spaces occupied by the names erased are equal, and are too small for those of Valerianus and Gallienus. The "Corpus Inscriptionum Latinarum" contains the inscriptions of two other pedestals dedicated to Flavia Publicia, one of which bore the names of Valerianus and Gallienus, and the other of an Augustus and a Cæsar erased exactly as they are in this one in question of the first three of the pedestals found. But among the ten which have been discovered since are five others dedicated to the same Flavia Publicia, and one of these bears the date corresponding with the year A.D. 257. Now these eight pedestals were all standing in the atrium at the same time, and it is impossible to suppose that, if there had been any reason for carrying into effect the *memoria damnatio* against Valerianus and Gallienus, their names would have been carefully erased from two of the pedestals, and left plainly legible on two others. The only other instance applicable of an Augustus and a Cæsar being Consuls together was when that office was held by Carinus and his son Carus, A.D. 283, but theirs could not have been the names erased from the pedestal of Flavia Publicia, for the reason that the office of Grand Vestal was then held by Coelia Claudiana.

### MARBLES FROM THE TEMPLE OF DIANA.

ON Thursday afternoon last week Mr. J. T. Wood lectured in what is now styled the Ephesian Gallery of the British Museum, leading into the Elgin Gallery, on "The Marbles from the Great Temple of Diana." The lecturer said that the finding of the Temple of Ephesus had been a difficult thing to accomplish, and that it was six years before he succeeded in hitting upon the site. It was found one mile from the city, among corn fields, on level ground where there was not the slightest sign of any ruins, and that accounted for the difficulty in finding the remains, and for the time occupied in doing so. Having found the site he discovered sufficient of the remains to enable him to make a true elevation of the temple, but there were some details still missing which, he hoped, would be obtained by further excavations. They had a rough diagram before them from which they would see that it had one hundred columns externally, each quite 6 feet in diameter, and very nearly 60 feet in height. Only a portion of the superstructure had been found, which was the lower part underneath the capitals, some of the lions' heads, and some of the enrichment of the cornice. The diagrams which they saw coloured were meant to show that the whole of the temple was coloured. The remains which they saw before them had lost their colour since they were placed in the museum, with but few exceptions, but there was one specimen before them in which the colour was clearly demonstrated. Several of the coloured diagrams would, however, show the state in which he found the fragments. He should tell them that these remains were found between 20 feet and 24 feet underground, and their being at so great a depth beneath the surface accounted for the great expense of these excavations, the Government having spent 12,000*l.* upon them during the five years which it took him to clear out the temple. Now, to begin with the base of a column before them, it was the base of an ordinary column, thirty-six of which were sculptured. The fragments were placed in that room pretty nearly as they were found in the temple, and this would give them some idea of the arrangement. The base before them was found 13 feet underground to the top of the base, and was the only specimen of a base found so far underneath. Fortunately there was enough left of it to enable them to make a drawing. It was between the Greek and the Roman style. The Greeks used the more refined cornice section, but the Romans were content to use the segment of a circle, and he thought there was not a right angle in all Greek architecture. To come to the sculpture of drums, the one before them he need scarcely point out was the finest specimen of sculptured columns, of which Pliny said the temple had thirty-six in all. This specimen was found at a great depth, but when they turned it up it was found to have very beautiful figures upon it. It was evidently an assemblage of the gods, the figure of Mercury being very prominent. It was a question whether this drum was at some former time mounted on a base, because, as they found in the temple of Apollo at Branchidæ, the few specimens remaining differed in outline and in ornamentation. He need scarcely tell them that the remains they now saw were from the last of the three successive temples. He found evidence that all the bases were of about the same size, and that the same marble was used. There were two stones at the end of the temple which, he believed, belonged to the frieze of the temple, and which were got out from the drums of the last temple. One which was marked H4 he believed would be proved to be, what he had always thought it was, a portion of the frieze. Upon it was a representation of Hercules struggling with a female figure, and he believed it was Hercules taking the girdle of the Queen of the Amazons. The stone was very much hacked and disfigured. Mr. Fergusson thought that a column had been placed upon this, but there were reasons to the architectural mind which precluded the idea that this stone could have been part of the pedestal of a column.

There was a second stone, which he believed was a portion of the frieze of the temple. Upon one side of it was a representation of either Hercules lifting Antæus, or Hercules struggling with Cacus, probably the latter. On the other side they had the figure of a stag. These were the only stones which he claimed to be portions of the frieze. There was a third stone which was found in the aqueduct, and another which might or might not have been a fragment of the frieze, but it was at all events a corner-stone. All these blocks were supposed to have come from the same building, but whether they were portions of pedestals, on which columns had been placed, as contended by Mr. Fergusson, was a question which would probably be decided by further excavations. Alluding to a fragment of a sculptured column marked H3, Mr. Wood said the question was whether Pliny would have called it a sculptured column if it had been of the height of this drum. Some people thought the columns in the diagram could not have been sculptured columns above the height of one drum, but he begged to differ from them. Passing on to another fragment of a sculptured column, the lecturer said he looked upon it as the most beautiful of all, and it was a pity it had been so much hacked about. This temple was built in the time of Alexander the Great, and when he visited Ephesus he wished to have his name inscribed upon it. These sculptured columns were very likely knocked off very quickly, and, if he were right in placing them, were sculptured to the height of three drums. The lecturer here pointed out other specimens, one being a beautiful stone which had formed part of the base of a column, and another in which the delicate proportions of the fillet between the flutings were very noteworthy. He further remarked upon fragments of roof tiles, lions' heads, and various fragmentary specimens of Ionic columns. There were also some splendid specimens of profiles of base mouldings, a representation of a medal of Gordianus found on the site, &c.

### ARCHDEACON THICKNESSE ON RESTORATION.

ON occasion of the annual visitation, Dr. Thicknesse, of Northampton, in his address alluded to the subjects of the maintenance of the fabric of ecclesiastical buildings and the custody of local registers and other documents. He said:—

It is a main part of my duty, in conjunction with the rural deans of the several deaneries in the archdeaconry, to stir you up to a full discharge of the duty of maintaining the churches in really good and substantial repair. I think it a good plan for churchwardens to take a particular survey before they answer the articles of inquiry, or immediately upon their appointment. You have now the whole summer before you for putting all good intentions into execution before autumn winds and winter rains set in. "It is the stitch in time that saves nine," and I venture to say that a watchful care and observation are as necessary in respect of a so-called restored as of an unrestored church. Because a church has been recently restored, churchwardens are sometimes too apt, I think, to feel it does not now need vigilance. Indeed, I have heard the expression, "It will do now for a hundred years to come." But how often a defective bit of work or incipient dry rot may be set to rights this year at scarcely any cost, which, if left to next, will have become very serious, or even beyond repair. I rejoice to say I have a list before me to-day of works begun, continued, or ended, of which any archdeaconry might be proud, and especially in the depressed condition through which all agricultural counties are passing. In the first place, there are three new churches in course of erection. The nearest to completion is the church of Silverstone—the second church for which we have to thank the generous proprietor of Whittlebury, Mr. Loder, M.P. I have visited it in company with Mr. Loder and the architect, Mr. St. Aubyn, and I was truly rejoiced to see so fair and goodly a structure standing on the site, and partly formed out of the materials of one of the most deformed specimens of the worst period of English architecture. The other two new churches are those of St. Crispin and of St. Mary, Far Cotton, for the foundation stone-laying of which we have recently had such happy and successful gatherings in Northampton. Then, to Lord Spencer's unvarying goodness and consideration, Dallington parish is indebted for a beautiful new chancel, which was consecrated and opened in November last; while Mrs. Whitworth, of Dallington Hall, has presented a new organ. To the Marquis of Northampton we owe a substantial and well-built aisle, with oak roof, to the still much dilapidated church of Yardley Hastings. A very important restoration, at a large cost, has been carried out at Towcester parish church, under the care of Mr. Pearson, R.A., a work which reflects the greatest credit both upon Mr. Pearson, and upon the vicar and the churchwardens, who were zealous beyond all praise, in obtaining so considerable a subscription at such a time. The further restoration of Long Buckby has been completed since we met in that church at a visitation last year. Very spirited efforts are being made by their incumbents for the restoration of Staverton and Clipstone churches; while at Moulton, Mr. Nethercote and Lady Loyd Lindsay have headed a subscription for the same object with 500*l.* each, and it is almost certain that the much needed reinstatement of that handsome but half-ruined fabric will, at no distant day, be successfully

accomplished. Paulerspury Church has been improved by His Grace the Duke of Grafton, in causing the clerestory windows to be filled with stained glass. Repairs, ornamentations, and improvements have been going on at Northampton All Saints', Northampton St. Edmund's, Watford, Earl's Barton, Adstone, Abthorpe, Thenford, Brackley, Cold Ashby, Daventry, Eydon, Duston, Mear's Ashby, and other places. A munificent gift of a peal of bells, at a cost of 1,000*l.*, has been offered and executed by Mr. Churchwarden Tomes, for the tower of St. Edmund's, Northampton; while at Moulton the bells have been thoroughly repaired; and at Wellingborough parish church the whole peal has been set in order, and a new bell given by a parishioner, and also a new organ erected in the church at a considerable cost. At Newnham a restored chancel is in contemplation by Mrs. Thornton, of Kingsthorpe Hall, while that honoured name deserves further record to-day, through the noble addition of a newly-built and carefully-planned vicarage house to the parish of Earl's Barton, raised at his own cost by Mr. Edward Thornton, the patron; and by him conveyed to the Ecclesiastical Commissioners, who, in return, have permanently given 50*l.* a year to that ill-endowed benefice.

There is a very important matter which recent discussion suggests connected with the responsibilities of both clergy and churchwardens, which I desire to bring forward to-day. I mean the custody of the registers. Although the rector, or vicar, or officiating minister is the custodian of these, as well as of all parish maps, terriers, and other documents, yet the churchwardens are bound to find the means of their protection and safety. It is enacted by the 52nd George III., c. 146, cap. 5, "That the several books wherein entries are to be made, and all register books heretofore in use, shall be deemed to belong to every such parish, or chapelry respectively, and shall be kept by, and remain in, the power and custody of the rector, vicar, curate, or other officiating minister, and shall be by him safely and securely kept in a dry, well-painted iron chest, to be provided and repaired, as occasion may require, at the expense of the parish, and which said books shall be constantly kept locked in some dry, safe, and secure place within the usual place of residence of such rector or vicar, if resident within the parish; and the said books shall not, nor shall any of them be taken or removed out of the said chest at any time, or for any cause whatever, except for the purpose of making entries, or for the inspection of persons desirous to make search for them, and immediately after be forthwith and safely and securely deposited in the said chest." It cannot be too forcibly impressed upon the minds of all parish officers that our old registers and maps are the history of families and parishes, and that most important matters of property depend upon their being preserved from fire and accident, and kept absolutely secure from the possibility of being tampered with. Anything like the request of an antiquarian or topographer, whether in the parish or out of it, to have the loan of a register book to take away with him for a day, or even for an hour, should be peremptorily refused by the incumbent. Nor should any applicant, searching the registers (whoever he may be) be allowed to search them alone; and if any person not authorised to possess them has, through inadvertence or neglect, obtained possession of these parochial heirlooms, an injustice is being perpetrated against the whole community, and application should be urged in the name of all for their restoration to the parish chest. I need hardly say an attempt is now being made to take the custody of the old registers away from the clergy, and to remove them from the parishes and carry them up to the metropolis, so that any one wishing to search them would have to go to London to search them there. I will not enter now upon all the arguments that might be advanced against the growing principle of centralisation in everything. But if our parishes wish to retain their own registers and parish history, it is obvious that the very first thing to be done is to cut off any shadow of complaint that may be urged against lax, and careless, and insufficient custody. The three archdeacons have agreed upon a form for certifying the security of the registers in every parish of the diocese, and these forms the clergy will receive through the rural deans.

#### UFFINGTON CHURCH.

THE members of the Oxford Architectural Society, in company with some members of the Newbury District Field Club, paid a visit to this church on the occasion of their recent excursion.

The vicar, the Rev. H. Gurney, addressed the visitors when assembled in the chancel, and said that the fact of their being two piscinas in this church had puzzled most archaeologists who had been there. The church told its own tale, being Early English throughout. The original Uffington church was founded by Fari-tius, nineteenth abbot of Abingdon, in the year 1105, and it was recorded that the abbot came there and urged the men to a more speedy completion of the work. There were no remains on this spot of the Norman church.

Mr. James Parker observed that the church stood almost unique in this particular—that it was a church absolutely of the same date

throughout, and they saw it as it came from the hands and mind, so to speak, of the one architect and builder. They seldom saw that in these days, as the great majority of old churches presented styles of architecture of later periods than that prevailing at the date of their erection. They had now the privilege of seeing everything complete of a church of the early part of the thirteenth century, probably dating from the year 1240 or thereabouts. The church was entirely characteristic throughout, in every detail, of the architecture of Henry the Third's reign. There were difficulties with regard to the historical evidence in this particular case. This church stood between two of the greatest monasteries of Berkshire—the abbey of Reading and the abbey of Abingdon—and if a Norman church had ever existed on that spot all traces of it had been entirely obliterated. His own view was that the Norman church at Woolstone had not been removed from Uffington. If such a church had been built at Uffington it would have been but a small one, and it might have been put, roof and all, inside the present structure. Most likely it was erected on an entirely different site to that on which the present church stood. Mr. Parker then pointed out the ingenious method by which the architect had been able to meet the difficulties of combining the erection of a central tower with the provision of a wide and roomy nave, without producing an unsightly effect; while in one or two modern attempts of the kind, which Mr. Parker instanced, the result had not been at all satisfactory. The straight-sided arches in the church were unique, and the mouldings throughout of a very beautiful description; indeed the church represented in a marked way the principal features of the mouldings that were met with about the middle of the thirteenth century. The ironwork on the church doors was interesting, and probably of the same date as the building. Some of the woodwork of the doors also appeared to be of the same date as the church itself, which was a rare circumstance. On leaving the sacred edifice, Mr. Parker drew attention to the fourteenth-century windows in the chancel, one large window indicating the position of the priest while saying the office, the extra amount of light being introduced for his convenience.

#### BUILDING IN NEW YORK.

A CORRESPONDENT writing from New York says that old buildings are being torn down by the hundred to make way for new, larger, and better ones. A great many blocks of new houses are being built, and vacant lots are being covered with edifices of a size and splendour never before seen anywhere in America. Street railways, parks, and aqueducts are projected, which will lead to the expenditure of at least 50,000,000 *dols.* if a majority of the schemes are carried out; one main cause of this activity being the long-continued decline of prices on Wall Street, and the anxiety of large numbers of small investors to find solid investments for their money. New York seems destined to be a city of large buildings. The community can grow only in two directions. One is longitudinally along the narrow island on which the city is planted; the other is perpendicularly. A strong effort is being made to keep the wealthier part of the population below the Park. The only way to do it is to construct dwellings of great height; and French flats and apartment houses are going up now in great numbers with this idea in view. The era of tall residences began about ten years ago. A few small "flats" were built, and proved quite successful. In 1875 a large number were projected, and since the past two years flats and large apartment houses have become the favourite investments of large operators, and they are now being constructed at the rate of 500 and 600 a year. Nearly 3,000 in all, of both classes, have been built so far. The apartment houses have been introduced from London. They are all six, eight, and even thirteen and fourteen storeys high. A great cluster of them stands near the lower end of Central Park on Sixth, Seventh, and Eighth Avenues, and others are scattered all over the Murray Hill region from Fourteenth Street to Fifty-ninth Street, which bounds the lower end of the Park. The tendency now is toward the building of apartment houses that are absolutely fireproof. Too few of the existing ones are of this description. Out of the 107,300 buildings in New York on January 1 last only 65 dwellings were reported as absolutely fireproof. The City Government will not now sanction the erection of apartment houses unless the plans which are submitted indicate an intention to use iron beams in the floors and cement partitions between the rooms. The finest apartment house in New York is now nearly completed. It stands in the region just below the Park already mentioned. The ground in this region is high, the air is good; the view from the upper windows is attractive, the Hudson river, with its panorama of active traffic, and Central Park with its diversified scenery are both visible; the finest private residences of the city are near by, and an elevated railway is close at hand to carry the inhabitants to the business centre of the city in twenty minutes' time. The apartment houses in this region range from 300,000 *dols.* to 1,000,000 *dols.* in cost, exclusive of the land; but the large one now building on Fifty-ninth Street, at the corner of Seventh Avenue, will, when completed, cost nearly 5,000,000 *dols.* (although this includes the land). A plot of ground 400 feet long and 200

feet wide is divided into eight squares, on each of which a house has been built eight storeys high on the street and fourteen storeys high in the rear. Arches and galleries connect the several buildings. The first storey or two is of stone, the rest of red brick, after the fashion current in the apartment houses of the city. Brick, cement, stone, and iron constitute the whole structure. The large suites of rooms cover one whole floor, and are arranged as follows:—Reception room, 14 feet by 28 feet; drawing room, 23 feet by 39 feet; library, 14 feet by 29 feet; dining-room, 20 feet by 23 feet; six bedrooms, ranging from 14 feet by 18 feet in size to 22 feet by 24 feet; three bedrooms for servants; kitchen, 18 feet by 20 feet; three dressing-rooms, with bath tubs; and a number of large closets and pantries. The smaller suites contain eleven rooms each, exclusive of closets. There are twelve suites in each of the eight sections of the structure. The suites of rooms are all to be sold outright to private owners. A courtyard 300 feet long by 40 feet wide remains open to the sky in the interior of the house. The apartment houses are growing in popularity yearly. The crowded condition of the business part of New York, on the lower end of the island, is leading to the construction of high buildings there also. Owners are compelled to economise in land, and gain capacity by going up into the air eight, ten, and occasionally twelve stories high. There are now about twenty tall buildings in the lower part of the city.

### NOTES ON HERALDRY.\*

TO the general public, and even to artists, the study of the ancient art and science of heraldry, or, more properly speaking, that branch of it known as armoury, is an anachronism, if not an absurdity. A learned judge (I rather think it was Lord Westbury) once heard a case in which the services of an heraldic expert were considered necessary and had been secured. In summing up, the judge referred to the herald as "that silly old man who did not even understand his silly old trade." Some other wise man has defined heraldry as the "science of fools with long memories." These dicta will suffice to show that heraldry, once a necessary part of every gentleman's education, has fallen into a low estate in these latter days. Without wasting time, however, in deploring "bad times," I will endeavour to briefly show that a knowledge of heraldry is still a worthy and valuable acquirement, especially for the architect. The study has not been altogether neglected in this room, for I recall with great pleasure a most excellent paper read here some years ago by Mr. Hummel. On many points I shall be contented to allow my remarks this evening to echo his.

In the first place, a knowledge of heraldry is a great, I may almost say an indispensable, aid to antiquarian study and research. Planché called it the "shorthand of history." Especially is it useful in deciding the dates and history of buildings. Our forefathers preferred commemorating themselves and their time upon the structures they raised by the pictorial language furnished by armorial details rather than by the simple use of numerals and lengthy inscriptions. I think, at any rate from a decorative point of view, they adopted the more excellent way. There is a drawing on the walls taken from Mr. Gotch's excellent book on Sir Thomas Tresham's buildings which shows the frieze of Rothwell Market House. This is a valuable example of the architectural use of coats of arms, and the interest of the building is greatly enhanced by such a graphic catalogue of the Northamptonshire gentry, contemporaries of Tresham. This is to name but one instance. In Mediæval and Early Renaissance times, however, the employment of armorial decoration was universal on walls, vaults, tiles, stained glass, &c., and every shield or badge told, and still tells to those who care to read, its own story.

I remember having to decide the date of a church tower on one occasion. Upon the cornice I noticed some carved badges, and at once the problem was solved. There were the badges of the sovereign, his queen, and the bishop of the diocese, and their concurrence enabled me to fix the date within a very close limit of years. The importance of a knowledge of heraldry to the student of literature I pass by, as being beyond the scope of my remarks this evening. But I cannot refrain quoting the reference to the Yorkist badge in the grand opening of "Richard III." "Now is the winter of our discontent made glorious summer by this sun of York." Heraldry has, too, its modern decorative use; indeed, if it had not, perhaps I should scarcely be justified in taking up your time this evening. If employed with knowledge and due purpose, the results to-day are as delightful and interesting as of old. In one point armorial detail always possesses an advantage over ordinary architectural ornament. It gives a "human touch" to the building on which it appears. The arms of the ill-fated Horsey family still remaining carved on a doorway at Clifton Maybank seemed to give, on our visit during last year's excursion, a sad, almost pathetic, interest to that lovely fragment of a once noble mansion-house. Touching this an old writer has said:—

"How great the dignity and estimation of arms ever hath been

and yet is we may easily conceive by this—that they do delight the beholders, and greatly grace and beautify the places wherein they are erected; so also they occasion their spectators to make serious inquisition whose they are, which is the owner of the house wherein they are set up, of what family their bearer is descended, and who were his next and who his remote parents or ancestors." Apart from this, heraldic ornament possesses an intrinsic charm in the almost infinite variety of its figures and the brilliant and charming contrast of its tinctures. With regard to the speculative question of the origin of heraldry the architectural student need not disquiet himself. The art, as far as we are concerned, may be considered as having been developed synchronously with Mediæval architecture. We may therefore dismiss from our minds that earlier heraldry which the old writers loved to fondly imagine, and with it all right to bear as descendants the arms gravely attributed to the "grand old gardener and his wife," with those interesting augmentations of fig-leaves and an apple. The old heralds "found" arms also for the twelve tribes of Israel (I possess a book with engravings of these), Noah, Japheth, "the nine worthies," &c., and even for Our Lord Himself. But enough of such folly, which has no more to do with true heraldry than alchemy has with science.

For the purpose of study I would recommend recourse as much as possible to actual examples of old armorial decoration. Grammars such as those of Planché and Boutell are most excellent and very useful to the beginner, but so much have the fantasies and absurdities of the sixteenth and seventeenth-century heralds affected all our literature on this subject that it is of very great importance to test all statements by independent study. The student in London has a mine of wealth in Westminster Abbey with its tombs of all dates, and St. Albans, with its (to my mind) almost unequalled examples of Mediæval heraldic carving, is not far away. Very good suggestions also may be obtained from the late tombs at Chelsea Old Church, St. Helen, Bishopsgate, and other churches of the metropolis. For the purpose of discovering the names of families who bore the arms you may find upon old tombs and buildings, where intrinsic evidence is lacking, the "Ordinary" compiled upon a unique plan by two architects, the late J. B. Papworth and A. W. Morant, will prove most useful. I have no intention this evening of treating you to a grammar of heraldry. I will, using as few technical terms as possible (although I must presume some slight knowledge of the subject on the part of my hearers), endeavour to touch upon some of the main divisions of the art, and draw attention to the points which appear most important to the architect. We will consider the heads of the subject in the following order:—The shield or escutcheon; the colours used to tincture the same, and its charges; the helmet and its crest; the minor accessories in an "achievement" of arms, such as mantling, motto-ribands, and supporters; and, finally, badges and rebuses. The shield is the most important figure in heraldic decoration. In Mediæval times it was first long and narrow, and its subsequent developments of form corresponded in some degree with the progressive changes of arch form in the architecture of that age. Unless the charges are simple the early form does not lend itself satisfactorily to their display. Mr. Hummel gave a good rule for drawing a "middle-pointed" or "beater" shaped shield, which is certainly a very excellent and beautiful type. I would, however, plead for freedom in shield form, especially in these days, when the military or chivalric character of heraldry has vanished. The later squarer and more obtusely-pointed escutcheons are much better adapted to receive numerous changes, especially when the coat is "quartered." With the growth of the Renaissance the forms of shield became more varied and the outlines more flowing. Eschewing such examples as are simply fantastic and "rococo" in character, in my opinion you will be able to select a greater variety of shields from buildings of this period thoroughly artistic, and yet suitable in form. Especially I would advise the study of Italian heraldic representation, as it possesses a greater freedom and beauty of line than we usually find in English work. Although wanting, perhaps, in pronounced heraldic feeling, I have seen simple oval or "cartouche" shields framed with vigorous scroll work, quite admirable in design so far as decorative effect was concerned. The arms of spinsters and widows are now invariably placed upon a lozenge-shaped figure, which does not lend itself, in my opinion, to very satisfactory treatment. The ladies are also denied the use of a crest. Perhaps in these days of reform they may be able to effect an improvement in these respects. The occurrence of the notch or mouth for the lance at the dexter or right-hand top corner of a shield often assists in giving improved character to its outline. A very beautiful escutcheon possessing this peculiarity is often found in Late Perpendicular buildings, especially, I think, in Somerset (*vide* "The George," Glastonbury; the Vicars' Close, Wells, &c.). There is an escalloped outline to the top and the base, and the surface of the field itself is delicately fluted. In Mediæval sculpture you will find other examples of varying the surface of the shield. There are early examples which are strongly convex, and in later times some may be noticed with a central ridge and "bracket" section, whilst others are concave. There are two or three forms of shield employed in Georgian times, which, on the score of ugliness, may well be avoided. Always endeavour to

\* A paper by Mr. Charles Richard Pink, read before the Architectural Association, May 30, 1883.

adopt an escutcheon with such an outline as will admit of receiving the charges of the coat you wish to represent with ease and good effect. The usual position of the shield is upright. It is sometimes, however, represented "*couchée*"—that is, placed diagonally. This variation often has a good effect; but when too frequently indulged seems to savour somewhat of affectation.

The tinctures (including metals) used in armoury are gold (or yellow), silver (or white), gules (red), azure (blue), sable (black), vert (green), and purpure (purple). The last is but rarely employed. Besides the foregoing, certain conventional furs are used for fields—viz., ermine and vair, with their respective varieties. Sometimes charges are blazoned as "*proper*"—that is, of their natural colours; but I may mention here, what I shall again have to refer to—viz., that heraldic representations must be conventional, and that the "*proper*" colour may generally be taken as meaning the one of the above tinctures which approximates most nearly to the natural colour of the object to be depicted. I need say but little respecting the tinctures themselves, except that there is no hard and fast rule of exact tint or tone for them, and the artist is not necessarily obliged to use the crudest colours on his palette. As to the furs, the designer should certainly have recourse to Mediaeval sources for inspiration. Ermine spots are especially most poorly drawn in these days. The three hairs, surmounted by three dots, is not an admirable arrangement. The old forms, either the wide-spreading brush surmounted by a *fleur-de-lis* form, or the simple patch of conventionalised fur, are every way more artistic. With regard to vair, which consists of small blue and white shield-forms placed alternately in juxtaposition, I would only mention that there is an ancient way of depicting it with wavy lines, which appears to me more graceful. The fact that the contrast of tinctures in heraldic decoration is always satisfactory is no doubt largely due to the general rule which forbids colour to be charged upon colour or metal upon metal. Whenever the situation admits of it, let your armorial details be painted. For the tincture is, of course, a distinctive and essential part of every field and charge.

I remember seeing once in some work by Mr. William White a shield introduced, the heraldic colours being obtained by inlaying various coloured marbles. Pray do not follow the common rule of indicating tinctures on stonework by tooling lines in different directions. Before the days of colour-printing this plan was adopted by heraldic engravers, and it proved an admirable one for their purpose. We, however, need not treat our buildings as if they were mere dictionaries of arms. The custom is destructive to the proper artistic treatment of charges upon shields, and it would be less obtrusive, and not one whit more absurd, if in lieu of scratchings and dottings we cut initial letters to indicate the tinctures, after the manner of the old heralds in "*tricking*" arms. Irrespective of any charges, the plain fields of arms may, in coloured decoration, be "*broken*" and varied by what is known as "*diapering*"—that is, covering them with fanciful diaper scroll-work, &c. Diapering may be most varied in designs, but its forms must be such that they cannot be for a moment mistaken for true heraldic charges. In carved work the diaper must be in the lowest relief to make it quite subordinate to the charges, and in coloured decoration it is perhaps best to let the patterns be put in with a darker shade of the tincture upon which they are placed. The simplest heraldic distinction in a coat of arms is a field of varied colour. This is formed by parting the shield with lines in various directions, such as vertically in the centre (*per pale*), quarterly, and so on, the different sections being of opposing tinctures. The dividing lines are sometimes themselves varied from the straight, and are wavy, dovetailed, embattled, &c. Where a shield is thus "*party*" of certain colours, do not attempt to enhance the effect of the divisions by any indications of shadow.

Now as to figures or charges, as they are called, placed upon the field. Foremost come those simple bands and other forms known in the grammars as ordinaries and sub-ordinaries. Such are the chief, the bend, the pale, the fess, the chevron, the cross, the bordure, &c. I need not give you a catalogue of them, as you will find them fully described in books on the subject. These simple charges may, in some cases, have been derived from constructional details of the shield, but they are just such simple forms as must almost have been perforce adopted by the heraldic painter wishing to differentiate shields in a clear and easy manner. Heraldic authors give exact rules with regard to the proportion of ordinaries, &c., to the field, and these are, no doubt, some guide to the designer. The study of ancient examples will, however, show that the old heralds did not allow themselves to be bound by rigid regulations in this respect, nor do I think they recognised as distinct charges the numerous diminutives of the ordinaries which are given by modern authorities. Working with thorough knowledge and true heraldic instinct and spirit, the old carvers and painters, while never permitting a coat to lose its identity, modified the size of the so-called ordinaries and other charges in order to produce a shield filled with a well-arranged and well-balanced heraldic composition. They never lost sight of this. One consideration which principally influenced them in deciding upon the width for any particular ordinary was whether it was itself to be charged with other figures, animals, or what not. Take the arms of Cardinal Beaufort, for instance: he bore "France and England

quarterly within a bordure gobony argent and azure." We find this shield constantly carved upon the buildings founded by him, and I have noticed that the bordure having no charges is always much reduced in width, in order to give ample display for the more important bearings on the field. The arms of Prince John of Eltham, which may be seen on his tomb in Westminster Abbey, are also "*within a bordure*." The bordure being charged, however, with numerous *fleurs-de-lis*, is much wider and more important than that depicted in the arms of Beaufort.

Another good example of variations in the proportion of ordinaries may be noticed in the two shields engraved in "*Boutell*," which belonged to different branches of the De Bohun family. One shows "*a bend cotised between six lions*"; the bend being uncharged is drawn very narrow, in order to give space for the display of the lions. The other coat is similar, but shows three escallops borne upon the bend as a difference. In this case the bend is widened so that the escallops upon it may be properly shown. To take one more instance of this desire on the part of the old heraldic artist to properly "*fill*" the shield; I know a coat which bears a pale of lozenges. Now these lozenges in modern representations (following the books) are shown with their longer diagonals placed vertically; but upon old tombs I have noticed that they are placed in the reverse position, no doubt the better to occupy the field, which is uncharged.

Now, as to general charges. In the early days of heraldry their variety was but small; but as time went on and coats multiplied, the necessity of making numerous distinctions forced the heralds to adopt images of all things in the heaven and earth, and in the waters under the earth. Old Guillim says:—"These arms are composed of natural things, as of some kinds of celestial bodies—viz., of the sun, moon, stars, &c.; sometimes of four-footed beasts or of birds, or of serpents, or of fishes or some other reptiles, or else of some kind of vegetables, as trees, shrubs, flowers, fruits, leaves, &c.; or else of some solid things, as castles, towers, mountains, &c.; or of things pertaining to arts liberal or trades mechanical, &c. Sometimes, again, they are compact of none of these, but do consist only of the variations of simple colours, &c." And, again, in another passage, he quaintly contrasts the items in this long catalogue of charges thus:—"The forms of the pure celestial bodies mixed with gross terrestrial, earthly animals with watery, savage beasts with tame, whole footed beasts with divided, reptiles with things gressible, fowls of prey with home bred, these again with river fowls, airy insecta with earthly; also things natural with artificial, arts liberal with mechanical, military with rustical, and rustic with civil." In representing any of the numerous figures used as charges, the most important thing to aim at is a due conventionalism of treatment. Heraldry as an art is decorative, but not pictorial. Take the lion, for instance, which, in different positions, is used more frequently than any other animate creature as an heraldic charge. Pray do not adopt the modern plan of giving a portrait (or caricature) of "*felis leo*." The heraldic lion should exhibit as "*unnatural*" and distinctive a type as does the heraldic "*tyger*," which is admittedly no near relative of the Bengal man-eater. The fact that a lion may have to be blazoned blue, red, green, black, &c., is sufficient to show that his heraldic representation must be quite conventional. The lion is such an important charge in heraldry that I would recommend the student to very especially study its treatment in old English and Italian examples. Endeavour to enter into the spirit and feeling of the old designers. Always infuse lions and other animal charges with "*go*" and freedom of movement and action. However extravagant and quaint the ancient figures may be, a lion's strength, fierceness, and activity are almost always expressed. Also especially note how lions (and other animals) were made to fill the shield. Old representations of the arms of England abound, and in them you will not find three lions depicted each being an exact copy of the other. On the contrary, you will notice that there is variety in the drawing of each lion, and that in order to properly cover the field the beasts vary in size, and their limbs are enlarged or reduced as may be required by the exigencies of the outline of the shield. Mr. Hummel, I remember, called attention to the fact that, in drawing lions rampant, modern designers always show the tail falling over from the back. In Mediaeval examples it turned over towards the back. Lions "*passant*" (or walking) are, however, properly drawn with the tail turned back, and not under next the body. The eagle is another common charge which should be carefully studied in the light of old examples, and the principles of its proper representation obtained. It will be found that the heraldic differs very widely from the natural type. German drawing of eagles (as also of other charges) is often very suggestive, though sometimes extravagant. If I remember rightly, there is some fine old German glass at the South Kensington Museum having some excellent heraldic figures of eagles.

It would be impossible this evening to go through even the commoner charges in order to point out how they should, or how they should not be represented. I would, however, particularly caution you against adopting the ordinary modern forms of the following—viz., trees, martlets, manches, hawks'-lines, water-bougets, mill rinds, crosses, labels, &c. I have some sketches here showing the proper representation of the label and the manche.

The examples shown of the latter charge will furnish another good instance of the modification in form and size of the principal bearing to suit the better representation of the other charges on the shield. When similar examples are met with, be sure to sketch and study them. Artistically speaking, it is of the first importance, as I have suggested before, to consider the general composition of a coat of arms, with a view to representing the same with an agreeable balance of parts and a well-covered field. Having obtained a proper knowledge and acquaintance with the science of heraldry, you will find that, within limits, the success of armorial design depends greatly upon the artistic feeling and skill of the designer. The disposition and size of charges may be treated with some freedom, as I have already pointed out, and merely mechanical arrangements and repetitions may be often avoided. Where there is but a single charge, let it fill the shield well; nothing looks poorer, for instance, than to see a shield bearing a lion rampant when the lion is drawn to a small scale in the centre, its limbs approaching nowhere near the confines of the field.

A representation of the Woodroffe arms from an old monument gives us another not unusual mode of adapting the size of the charges to the space to be filled—viz., in cases where there are three similar charges divided, "two and one" by, say, a chevron or fesse, to considerably increase the size of the one placed in base. Although this plan is quite admissible, it is in some cases better (if the form adopted for the shield will admit of it) to endeavour by careful arrangement to obtain similar sized spaces for the three charges, so that they need not be varied greatly or at all in bulk. Old representations of the arms of the great architect, William of Wykeham, are as noteworthy in this respect as modern copies of the same usually are for particularly bad arrangement of charges. In one public building I have even seen the arms of Wykeham painted in wrong tinctures. Sometimes one charge is allowed to entirely "abscond" or obliterate others. During last year's excursion we noted a good example of this in the arms of Young at Trent. These are thus described—"three roses and a canton gules;" but in representing them the canton covers one of the roses, and only two therefore are allowed to actually appear on the face of the shield. I need not proceed further this evening with this branch of our subject.

(To be continued.)

## LEGAL.

### High Court of Justice, Queen's Bench Division.—May 28.

(Before Mr. JUSTICE FIELD, without a Jury.)

#### BARNARD v. CARR.—ANCIENT LIGHTS.

This was an action arising out of an alleged interference with the plaintiff's rights to ancient lights.

Mr. C. Matthews, Q.C., and Mr. Hadley appeared for the plaintiff; and Mr. Swan and Mr. Raven were for the defendant.

The plaintiff is the owner of a house in Prince of Wales's Terrace, South Kensington, and the defendant is Mr. J. T. Carr, who about the year 1880 purchased the well-known property of Baron Grant's, Kensington House, with the object of building thereon. The plaintiff's house was situated about 12 feet to the eastward of the boundary wall of this property. And it was proved that the windows, the obstruction of which he now complained of, had existed for twenty years. It was also proved that from 1875 until 1883 there was a trellis work some 40 feet to 50 feet high erected on Baron Grant's land, running parallel to, and about 20 feet distant from, the plaintiff's house. It also appeared, though the evidence on the point differed somewhat, that this trellis work was partially covered by ivy and Virginia creeper. It was taken as admitted that this trellis had been erected with notice to the plaintiff of the fact, who had not apparently objected to it, having purchased his present house after its erection. This being the state of things, it appeared that about July 1883 the trellis work was removed, and the defendant began building a row of houses parallel to Prince of Wales's Terrace, and some 18 feet distant from it. It did not appear that the plaintiff had taken any steps to stop the building in question until October 1883, and in November he obtained an interim injunction in this action restraining further building operations. By this time, however, it appeared that the back wall had reached a height of 41 feet. The plaintiff's case was that the comfort of his house, as well as its selling and letting value, was materially injured by the buildings in question. The defendant first of all contended that the windows in question had not existed twenty years, but the learned Judge ruled against him on that point, as well as another—viz., that the trellis work, alluded to above, was, in effect, such an interruption of the plaintiff's right to ancient light as to be a bar to the present action, under 3 and 4 William IV., chap 71, secs. 3 and 4. The question, therefore, was ultimately narrowed down to whether or not the defendant's building substantially or materially interfered with the plaintiff's rights of air and light, and so gave him a right of action? If it did, what relief was he entitled to?

Mr. Justice Field having heard the evidence of both sides, carefully reviewed the evidence and all the peculiar circumstances of the case. His Lordship referred to the contention by the defendant that the plaintiff's windows were not entitled to ancient lights, and decided the point against him (the defendant). He did not think it necessary to decide whether or not the trellis work was a sufficient interruption to prevent the plaintiff acquiring the easement which he claimed. It was sufficient for him to decide the case on the ground that there was no evidence to show that the comfortable enjoyment of the plaintiff's house had been materially diminished by the defendant's building operations. There would be, therefore, a verdict and judgment for the defendant.

### Worship Street Police Court.—May 29.

(Before Mr. BIRON.)

#### DISTRICT SURVEYOR FOR EAST HACKNEY (NORTH) v. HAWKINS.

The defendant had erected in the rear of his house, No. 9 Rushmore Road, a shed constructed of woodwork, the wall of the house facing one side of it. The roof was covered with felt. It was 16 feet 6 inches long and 6 feet 6 inches wide, the average height being 5 feet 9 inches. It contained two tricycles. There was no direct communication between the shed and the house. The District Surveyor, following the decision in the case of himself v. Snewin Bros. & Co., considered the shed was an alteration, addition, or other work in, to, or upon the building, No. 9 Rushmore Road, and it was subject to the regulations of the Building Act, which required that the walls and roof should be of incombustible materials. The magistrate considered the shed was not an addition to the house, there being no direct communication between them, and that the rules of the Building Act did not apply to such structures, but he would grant a case.

## WORKS IN PROGRESS.

**The Refreshment Rooms** adjoining the Albert Hall, in connection with the International Health Exhibition, have been decorated with Messrs. Rotmann & Co.'s Japanese leather papers.

**The East Window** of St. Michael's Church, Bournemouth, has lately been filled with Munich stained glass, the gift of Miss Durrant, of Branstead Hall, Norfolk, in memory of her uncle, the late George Durrant, Esq., of Norwich, through whose beneficent acts the church was mainly erected. The text illustrated is Matt. xi. 28, "Come unto Me all ye that labour." The artists are Messrs. Mayer & Co., of Munich and London.

**Chester Cathedral.**—A new east window has been erected in the above cathedral—subject, The Presentation—filling the five lights thus:—Centre light, the priest holding the infant Saviour, on either side the Blessed Virgin Mary and St. Anna, and, in the outside lights, St. Joseph and Simeon. In the tracery is represented the Annunciation and emblems of the Holy Trinity, with angels below holding scrolls, bearing inscriptions of praise taken from 1 Chron. ii. Thus the window is full of theological import. The style is Perpendicular, and the general effect very light and lace-like. The quiet, though rich tone of colouring harmonises well with the warm colour of the walls. The window was designed and executed by Messrs. Heaton, Butler & Bayne, of London.

**The Durham Colliery Owners' and Coal Consumers' Association, Limited**, 16A Baker Street, London, W., have introduced a patent smoke-preventor and coal economiser, which insures perfect combustion, cures smoky chimneys, and burns coke, anthracite, and bituminous coal with equal facility, and is applicable to any existing grate or open fire range. We understand its effectiveness has been proved, and it is a very inexpensive appliance. The necessity for disestablishing existing fire-grates or adopting unsightly objects seems to be entirely avoided by this arrangement, which can be made in any ornamental style.

## CHURCH BUILDING AND RESTORATION.

**Idle.**—The Old Chapel at Idle has been undergoing renovation, the building, which was erected in 1630, having become somewhat dilapidated. The building is used as a Sunday school in connection with Holy Trinity Church, and as an elementary school for infants, one portion being also occupied as the Church Institute. Improvements are to be carried out at Holy Trinity Church, Idle. It is proposed to reseat the whole of the body of the edifice with pitch pine seats, abolishing the box pews which have served to the present time. New choir stalls of pitch pine will also be added; the chancel will be laid with encaustic tiles, and the aisles relaid with concrete in tinted colours. The church will be thoroughly ventilated, and the interior painted and decorated. The above works of restoration and renovation are being

carried out under the supervision of Mr. Jowett Kendall, architect, of Idle.

**Walkden.**—The memorial-stones of a Wesleyan chapel have been laid. The new erection is estimated to cost about 3,500*l*. The building has been entrusted to Mr. J. Allen, of Radcliffe, and the plans were prepared by Mr. A. W. Smith, architect, Knowsley Street, Manchester. When completed the structure is estimated to seat 700 persons. It will be in the Renaissance style of architecture; the external facings are to be of brick dressed with terracotta and red Runcorn stone. In the interior a gallery has to be erected all round the edifice, and a minister's vestry and choir and organ apsis are to be constructed. All the fittings will be of polished pitch pine, and hot-water heating apparatus will be provided.

## NEW BUILDINGS.

**Consett.**—The town hall just erected at Consett was opened on Monday. The building has been erected from the designs of Mr. W. L. Newcombe, F.R.I.B.A. (of the firm of Messrs. Newcombe & Knowles), Newcastle. It is built of stone, in Early English style. The exterior of the building, from its size, general dimensions, is well grouped together with the tower, which rises to a height of 86 feet. Mr. Geo. Westgarth, of Newcastle, was the contractor, the clerk of works being Mr. W. Burrell, of Lanchester.

**Birmingham.**—The inscription-stone of the building of the Birmingham School of Art was laid on Saturday by Mr. Richard Tangye. The site of the new school, which has been given by a local landowner, Mr. Colmore, is a commanding one in the centre of the town, and in close proximity to the town hall, the council-house, the Mason College, the Midland Institute, the new art gallery and museum. The cost of the building itself is estimated at some 25,000*l*. The design, by the late Mr. John Henry Chamberlain, is in the Gothic style, and consists of a central block, and two wings of red brick and stone, relieved with terracotta and tile work. The work is being carried out under the direction of Mr. W. Martin.

**Darlington.**—On Wednesday Sir J. W. Pease, M.P., laid the foundation-stone of a Free Library in Crown Street, Darlington, the building being the gift of his late brother, Mr. Edward Pease. The building, which it is estimated will cost about 5,000*l*, will be in the semi-Queen Anne style, of red pressed bricks, liberally relieved with Dufton stone. The length of the main front will be about 100 feet, and the depth 90 feet; and the library, reading-room, &c., will be of large dimensions. Mr. G. G. Hoskins, of Darlington, is the architect.

## GENERAL.

**The Committee** charged with the erection of a bust to Burns in Westminster Abbey have unanimously resolved to commission Sir John Steell, R.S.A., to execute the work.

**Sir Joseph Pease, M.P.**, on Monday, unveiled at Middlesbrough a bronze statue of the late Mr. John Vaughan, partner of the late Mr. W. H. F. Bolckow. The statue is by Mr. Lawson, of London, and stands 8½ feet high on an ironstone pedestal.

**The Third Annual Exhibition** of the Leicester Society of Artists opened on Monday in the rooms of the society, St. George's Chambers, Leicester. Among the exhibitors are Mr. Alma Tadema and Miss Clara Montalba.

**The Yorkshire Fine Art and Industrial Exhibition** for the ensuing summer season was opened at York last week. The art department includes well-known pictures by the old masters belonging to the Earl of Feversham, Lady Mary Thompson, and the fine collection presented to the committee by the late Mr. Burton, of Poppleton, near York. There are also numerous high-class pictures from private collections.

**The International Exhibition at the Crystal Palace** is so far completed, both in the Industrial and Fine Art Sections, that the jury in the latter division have completed their labours. The awards, which were made *inter alios* by Mr. W. O. Orchardson, R.A., Mr. G. A. Storey, A.R.A., Mr. P. R. Morris, A.R.A., Mr. John Burr, President of the Society of British Artists, are one hundred and ninety in number, and include, for the United Kingdom, diplomas of honour to Sir Frederic Leighton, P.R.A., to Mr. S. Cousins, R.A., the Royal School of Art Needlework; and diplomas of recognition to Fine Art Society, the Graphic Collection, and to Messrs. Cassell and Company. The diplomas for foreign countries are to Japan, for a large bronze Koro and stand, the work of Ichikawa Raijiro, of Tokio; to the "Gesellschaft für Vervielfältigende Kunst," Vienna; to Adolph Holzhausen, of Vienna; to Mr. R. Schuster, of Berlin; and a diploma of honour to Mr. W. Roelofs, of Brussels. The greater number of gold, silver, and bronze medals have fallen to the United Kingdom,

France, and Germany; but the Netherlands, Belgium, Italy, and Scandinavia obtain a fair proportion.

**An Exhibition of Pictures**, belonging to the Marquis of Bute, was opened on Tuesday in the great central room of the Glasgow Corporation Galleries. The pictures in question—recently exhibited at Bethnal Green Museum—have been selected from the famous collection got together more than a hundred years ago by Lord Mountstuart, afterwards fourth Earl and first Marquis of Bute—the most important of all the collections formed in England before the French Revolution, as regards the representation of the Dutch and Flemish schools.

**Mr. James Valder**, the engraver who chased the beautifully-executed portraits on the Wellington Shield, which was presented to the Duke of Wellington in 1823, died last week at his residence, Newington, Hythe, in his eighty-eighth year. The shield, which is a massive work in silver richly gilt, with a diameter of 3 feet 8 inches, was executed from designs made for the purpose by the Royal Academician Stothard, and was stated to have cost 15,000*l*.

**The Sum** of 7,062*l*. has been subscribed towards the cost of restoring and enlarging Dewsbury parish church. About as much more is required, exclusive of what is needed to raise the tower another stage.

**The Convent of Letraki**, in the suburbs of Athens, has offered the English Ambassador a piece of ground of over 6,000 square metres for the English School of Archaeology.

**The Annual Conversazione** of the Institution of Civil Engineers was held last week. Sir J. W. Bazalgette, the president, and Lady Bazalgette received the company, numbering some three thousand persons, at the South Kensington Museum.

**Mr. John Price, Assoc. M.Inst., C.E.**, engineer and surveyor to the Barton-upon-Irwell Sanitary Authority, has recently been appointed surveyor to the Toxteth Park Local Board, at a salary of 350*l*. per annum. There were 140 candidates, and out of this number the following four were selected along with Mr. Price for consideration by the Board, viz., Mr. Armitage, chief assistant, Borough Engineer's Office, Preston; Mr. S. G. Gamble, Assoc. Inst., C.E., borough surveyor, Grantham; and Messrs. Goldshaw & Wood, of the City Engineer's Office, Liverpool.

**Mr. H. T. Wakelam**, late borough surveyor of Oswestry, has been appointed borough surveyor of High Wycombe. The town of Oswestry has apparently lost the services of a good officer by economising at his expense.

**Mr. R. Yates**, architect, has prepared plans for the erection of a school at Wrockwardine.

**The Members** of the archaeological section of the Birmingham and Midland Institute began their summer excursions last week with a visit to Hereford Cathedral. Visits were also made to places of interest in the neighbourhood, and among others to Kilpeck Church and Castle. The church is probably the most perfect example of a Norman church in England, retaining a curious vaulted semicircular apse. The south door is elaborately carved with numberless fanciful devices, the pews enriched with full-length figures, affording valuable examples of early costume. The chancel arch and the corbel tables surrounding the building are also curiously carved, and at the west end are enormous heads, apparently intended for those of crocodiles.

**The Executive Committee** of the Carlisle Church Congress, 1884, has purchased the Circus which stands on the Warwick Road for 519*l*, upon the valuation of Mr. George D. Oliver, architect, to whom the question of the value was referred as arbitrator. The Circus will be transformed into the Congress Hall, in which the principal meetings will be held, and the Drill Hall will be used for meetings of the second class.

**The Caradoc Field Club** have held their first meeting for the season at Shrewsbury, whence the members started to Condover. Among the places visited was Plaish Hall, where the visitors inspected the banqueting-hall, with its music gallery; the inlaid wainscot of the drawing-room, and other old oak carving, as well as the curious arrangement of the attics and the chimneys, for which the building is especially remarkable.

**The Workington School Board** have adopted plans, prepared by Mr. George D. Oliver, of Carlisle and Workington, for a group of schools, accommodating 800 children in three departments, together with a master's residence.

**The Liverpool City Council** on Wednesday resolved to purchase, at a cost of 200,000*l*, an open space in the suburbs known as Kensington Fields, about 50 acres in extent. The Corporation feared that the land would pass into the hands of the speculative builder, and they are taking it with a view to the erection of "middle-class residences of a substantial kind."

**At a Meeting** of the Hanley, Stoke, and Fenton joint-committee for the erection of a contagious diseases hospital, Mr. G. W. Bradford, of Hanley, was appointed architect of the proposed hospital, to be erected near Bucknall, at a cost not to exceed 4,000*l*, of which 750*l*. has already been expended in the purchase of the site.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JUNE 7, 1884.

### COMPETITIONS OPEN.

Newby Bros. . . 448 0 0

## RINGSTOWN.

For Building House at Ringstown, near Mounbrath. Mr. WILLIAM I. CHAMBERS, Architect, 5 Westmoreland Street, Dublin.  
ROB (accepted) . . . £585 0 0  
There were ten estimates, ranging from £1,000 to the above down.

## ROTHERHAM.

Street Works, Rotherham.  
Kell . . . £299 0 0  
Ripley . . . 200 0 0  
Morton . . . 194 0 0  
Hill . . . 193 0 0  
Pugh . . . 190 0 0  
H. Wake . . . 188 0 0  
R. H. WAKE (accepted) . . . 185 0 0  
Borough Surveyor's Estimate . . . 196 10 0

## SADDLEWORTH.

For Building Independent Methodist Sunday Schools, Delph, Saddleworth. Mr. ALEXANDER BANKS, Architect. Quantities by the Architect.  
Accepted Tenders.  
Winterbottom, Delph, stonework, brickwork, and slating.  
Hewkin Bros., carpenter and joiner.  
Whitehead, Dobcross, plastering.  
Wood, Delph, plumbing, glazing, painting, and gasfitting.

ROWLEY REGIS.

For Enlargement of Blackheath School for the Rowley Regis School Board, for 110 Children in Girls' Department. Mr. J. T. MEREDITH, Architect, Kidderminster.

Bate, Dudley	£800 0 0
Holland & Son, Dudley	720 0 0
Round, Oldbury	710 0 0
Harley & Son, Smethwick	700 0 0
Allen, Birmingham	690 0 0
Trow & Son, Wednesbury	667 0 0
Willetts, Old Hill	629 0 0
Dorse & Son, Cradley Heath	580 0 0
Cockin & Son, Old Hill (accepted)	566 0 0

SOUTHAMPTON.

For Drainage Works in Rockstone Place, Southampton. Mr. W. B. G. BENNETT, Borough Surveyor.

Laver	£157 0 0
Bull & Sons	139 0 0
Martin	137 0 0
Crook (accepted)	133 10 0
Crook & Smith	120 0 0

SOUTHPORT.

For Additions to the Mornington Road Wesleyan Schools, Southport. Messrs. MAXWELL, TUKE & HURST, Architects.

BRIDGE, Burscough (accepted)	£4,400 0 0
------------------------------	------------

SPRAGUE & CO.

Lithographers, Engravers, and Printers, 22 Martin's Lane, Cannon St., London, E.C.

BILLS OF QUANTITIES, SPECIFICATIONS, REPORTS Copied or Lithographed with rapidity and care.

SPRAGUE'S "INK-PHOTO" PROCESS FOR REPRODUCING COLORED DRAWINGS OR PHOTOGRAPHS.

PLANS of ESTATES, with or without Views, tastefully lithographed and printed in colours.

PHOTO-LITHOGRAPHY.

CERTIFICATE BOOKS for Instalments, 3s., or with receipt, 5s. Bill Paper, 17s. 6d. & 25s. per ream. SPRAGUE'S TABLES, upon application.

SPALDING.

For Erection of Outbuildings at Farm, Moulton Marsh, for the Governors of the Endowed School.

Gilder, Holbeach	£86 15 0
Fawer, Holbeach	86 10 0
Moore, jun., Spalding	80 0 0

# DRUMMOND'S PATENT GLAZING.

**H**AS no RIVAL, and is suitable for universal application for every description of ROOFS, either Wood or Iron, Straight or Bent, Cupolas, Greenhouses, &c., &c. Pronounced by Architects, Engineers, Builders, and the Glass Trade generally, to rival every other system of Roof Glazing, where a thoroughly substantial and water-tight job is required; and the only system of Patent Glazing yet introduced that is suitable for ordinary Wood or Iron Sash Bars, as no Water can penetrate from the Surface of the Glass to the edges, and that has stood all the late Storms of Wind and Rain without a complaint.

Fig. 1 is Section of Roof—A A are Side Slips fitting tightly on the edges of the Glass, and filled with prepared Putty that will not dry or harden. C is Cap in zinc, copper, or lead, showing allowance for Side Slips to expand or contract with the Glass, G. B is Bar of Wood or Iron.

Fig. 2 shows Section of Roof.

C—Lead, Zinc, Copper. 1 Brass Flanges folded down on Glass.

F—Perspective view of Patent Iron, Zinc, or Steel Bar, with Lead folded down on Glass.

H—Chair for fixing Bars to Purlins when required.

I—Bolt and Nut to secure Metal Flange inside at bottom.

J—Water Gutter.

## DRUMMOND'S PATENT ROOF VENTILATION.

1st—No cumbersome wood opening frames required.

2nd—Roof has a much neater appearance, more light, and perfect ventilation.

3rd—Minimises breakages to the lowest possible point as compared where opening frames are used.

REFERENCES, MODELS, AND ILLUSTRATIONS MAY BE HAD BY APPLYING TO

## DRUMMOND & LINDSAY,

55 LOTHIAN ROAD, EDINBURGH; OR 89 ABERCROMBY STREET, GLASGOW.

## CASES FOR BINDING THE ARCHITECT.

Price Two Shillings.—Office: 175 Strand, London, W.C.

# The Architect.

## THE CLOSING MEETING OF THE INSTITUTE OF ARCHITECTS.

THE Long Vacation of the Institute commenced on Monday night a few minutes before ten, and will last until the third day of next November at eight o'clock. In making the formal announcement of this somewhat leisurely arrangement, the President, Mr. CHRISTIAN, very properly expressed the hope that at the close of the interval of rest he might find the members returning to work refreshed by a thorough enjoyment of their repose. We sincerely echo the Presidential utterance, and with this addition—that we

trust the gentlemen thus graciously released from the labours of academical life may do as much work in the next session as they have done in the last, and, if they wish, a little more. Our readers are aware that the administrative arrangements of the Institute are now being overhauled by a committee of reform; perhaps amongst the rest it might not be amiss if this tribunal were to inquire what is the necessity for the affectation of suspending proceedings for five months at a time, to say nothing of other holidays, by way of affording annual relaxation to men of business whose real holiday consists, like other people's, in a few weeks snatched from their daily work in the autumn.

The meeting of Monday evening, we regret to say, was not a satisfactory one. The programme was promising. Mr. BUTTERFIELD was to be presented with Her Majesty's annual gold medal, and Mr. WOOD "of Ephesus" was to give an account of his recent operations upon the site of great DIANA'S Temple. Mr. BUTTERFIELD (to use vernacular phraseology) did not turn up; and Mr. WOOD's demonstration ended, and indeed began, in that most unprofitable of all collisions architectural, a difference of opinion with Mr. FERGUSSON.

We ought not to omit to mention that the ordinary medals given annually to students were also to be presented; and, in fact, this part of the proceedings was all that could be called successful. Mr. CHRISTIAN, when speaking of the work of students, always displays a certain genial enthusiasm which carries one away in an irresistible manner. It is as if, after bearing in his own person the burden and heat of the day—for he is no carpet knight—he were rejoicing unwearied still in the remembrance of the jubilant vigour of the morning. As one of the pioneers, in fact, of the "sketchmanship" of the age, he prefers to regard the young men before him as every one a sketcher such as he himself once was. "Spend your last shilling," he says to them, therefore, in sketching; and, with a certain grain of salt, the counsel is good in these days. For these are artistic days emphatically in English architecture, and it seems very likely that for a good many years now to come the progress of the rising generation of architects, in the direction of their public usefulness, must be more and more bound up in sketching, or, in other words, in that particular dexterity of artistic touch which constant and enthusiastic exercise in free-hand drawing of the freest can alone produce. At the same time we will ask Mr. CHRISTIAN to allow us to remark on his behalf that when the last shilling is expended in sketching, it is to be hoped that the sketcher has not forgotten to expend a shilling or two before the last upon certain subjects of study which may be called a little more substantial, if not even more essential.

When the recipient of the Royal Gold Medal of the Institute is a gentleman who, although in good health, is too "retiring" to attend in person to receive it, the situation (not to put too fine a point upon it) is a trifle wanting in muscularity. Strangers and others of the comparatively uninitiated sort who were present on Monday evening may well be excused if they opened their eyes a little on being told that the distinguished architect of All Saints' Church in Margaret Street and Keble College at Oxford had expressly bargained with the Council that if he were to be expected to do such a thing as attend a meeting at Conduit Street he must not be asked to accept the

medal! This may remind us of another distinguished personage, equally "retiring" in his way, who actually threw the medal, we may say, like Mr. WHISTLER's famous paint-pot, at the head of the public, with a contemptuous demand to know whether *that* was "a time to be giving and receiving medals." Nay, in the minds of the more flippant amongst us, even the "happy thought" of our sprightly BURGESS may perchance come up again in which the "blue ribbon" of English architecture was proposed to be "shot for by the Artists' Corps." All this, in a word, is at the least undignified; and Mr. BUTTERFIELD might at any rate have gone so far in the direction of social courtesy as to induce his medical man to recommend him, in some supposed state of his nervous system, to avoid the risk of emotion.

The Council, however, did their best in the circumstances. Mr. PENROSE, the immediately preceding gold medallist, was engaged to appear as the recipient's agent; the President had written a very nice little address, which he very nicely delivered; a copy of this document was handed over with the medal, to represent the utterance which ought to have taken place in the recipient's proper presence; Mr. PENROSE made a gracious reply; and everybody consented to forgive, if they could scarcely forget, the extreme bashfulness of a great Gothic artist. It is at least satisfactory to feel that there is probably no one else amongst the Mediævalist brotherhood who would exhibit the same unflattering timorousness in the same flattering situation.

Mr. WOOD, as we have said, has fallen out with Mr. FERGUSSON about the Temple at Ephesus. Of course it was Mr. FERGUSSON who fell out with him first. The energetic author of the "History of Architecture" is a man who reserves to himself the right divine of forming opinions of his own and expressing them in his own way, no man daring, if he be wise, to try to make him afraid. No doubt it is customary with some intelligences of the higher order to defer a little, in a question of intellectual specialty, to the opinions of the specialist. He may be wrong, but a certain delicacy is felt in telling him so; he has created a new item of knowledge, and he is considered to have a sort of right to dictate about it, and much more to object to be dictated to. But Mr. FERGUSSON, at any rate, may be said to accept this rule within strictly rational limits. In architectural criticism, to which he has unquestionably rendered wonderfully good service, he is especially independent. He is not in any way an architect, and in every way a great amateur. From professional prejudices and traditional trammels he is consequently free, and he adds to this relief the further freedom of a remarkably powerful scientific mind. He seems to feel that life is not long enough to be wasted in mere amenities, and that the compromise of his own casual opinions is the compromise of immortal truth. Those who differ with him—or from whom he differs—must take him therefore as he is, and make what excuse they may for his vehemence in recognition of his value. Accordingly, when Mr. WOOD, in dealing with the well-known passage in PLINY which describes the great Ephesian temple as having possessed one hundred and twenty-seven columns the gifts of kings, is constrained to read it in the sense that there were one hundred columns, twenty-seven of which were the gifts of kings, as the only means of making other conditions fit together, we cannot wonder, first, that Mr. FERGUSSON should try his hand at some other solution of the enigma, or, secondly, that having in his own opinion found it, he should scout Mr. WOOD's hypothesis with characteristic scorn. But when Mr. FERGUSSON in his turn, in order to accommodate the singularly odd number of one hundred and twenty-seven columns on the plan of a Greek temple, in which it is primarily held to be an essential condition of Classic symmetry that the axial line shall cut the entire columnar arrangement into perfect halves, resorts to the bold contrivance, while making the pronaos or front portico a range of eight columns (so described specifically by VITRUVIUS) according to rule, gives to the posticum or rearward portico *nine* columns, in defiance of the very foremost of all the architectural principles that we have been accustomed to rely upon in Classic design, it need not surprise us to find Mr. WOOD groaning in spirit to see the result of his lifetime's labour in a great critic delivering criticism like this, and a professional public listening to it without impatience. Accordingly, Mr. WOOD's expected description of his findings at Ephesus turned out to be an emphatic assault upon Mr. FERGUSSON's "restoration." In reply to this the Secretary was somehow furnished

with a much more emphatic communication from Mr. FERGUSSON attacking Mr. WOOD's restoration. The meeting was vastly amused, of course, and perhaps it was wise in the Chairman quickly to apply the *détour* to a debate which might have followed up the controversy somewhat inconveniently. Probably the best way out of the difficulty is to suppose it possible that the excellent PLINY himself had made a slight mistake in his numerals, and, while thanking Mr. FERGUSSON for his too ingenious calculation, to leave Mr. WOOD for the present in possession of the field which is his own. The majority of architects will certainly prefer to let the question thus remain for a long time to come, rather than accept the suggestion that, even in the age of ALEXANDER THE GREAT, a Greek temple, the most splendid in the world, could have had a portico with a column instead of an interspace in the middle—a disposition which is only worthy of a cockney gable after the order of Queen Anne.

### THE ASSESSOR IN ARCHITECTURAL COMPETITIONS.

THE large number of architects who supported the STREET memorial to the President and Council of the Royal Institute of British Architects, and the still larger number who have since voluntarily entered into an agreement not to take part in any public architectural competition unless one or more assessors are appointed to advise the promoters, is a strong proof of the great importance the profession place upon the necessity of such a course being adopted. When we look down the list of names, and see that it embraces those best known in London and the provinces, we cannot but think and hope that a great reformation may be worked in time. Reform generally works slowly, and the advocates of this method of selecting designs must wait with some patience before the object they seek is accomplished. Most architects, we may assume, agree that the selection of designs by a specialist is better than leaving it to a committee of laymen, who, however desirous of acting fairly, cannot be expected to possess that discrimination and knowledge of architecture, embracing plan, construction, and cost, sufficient to constitute them competent judges. Here and there committees and men may exist who from special training are more capable of weighing the merits and demerits of a plan, but such instances are rare, and any architect in practice knows with what patience and trouble he has to go over his design with a committee or private clients before he can make them understand his drawings, and explain his intentions. If such a difficulty exists with only one design to deal with, the difficulty is multiplied with rival designs to select from. Architects will readily admit this, but will at the same time withhold their adhesion to the agreement their brethren have signed, on the ground that work is scarce, competition in all its forms keen, and that, admitting all the evils of the lottery, they cannot afford to throw away any chance, however remote, and however unfair the terms upon which they are asked to compete. This attitude on the part of so many professional men constitutes a serious barrier to the success of the scheme to which we have alluded. The contest for bare subsistence is carried on so sharply, the number of men in the profession is so large, that no wonder need be felt that many stand aloof, and are quite content to see their brethren who choose to do so, tie their hands, and refuse to compete unless an assessor is appointed. Others again think that this agreement not to compete does not go far enough, and that all manner of stringent regulations ought to be made; others that men ought to agree not to compete on any terms whatever; that the system of competition is altogether a gambling sort of undertaking, a ruin to good architecture, destructive of everything that is respectable and honest in professional practice. Be this as it may, the profession must recognise the fact that it exists in every walk of business life, and that, rail against it as we may, our masters, the public, will it, and architects by the score respond with alacrity to the call. This being the case, it is in our opinion far wiser to recognise the fact, and endeavour by all legitimate and common sense means to regulate the traffic. We have frequently heard it stated that a fair way of selecting designs would be that each competitor should have a vote, and that the competitors themselves should decide to whom the prizes should be awarded. A little consideration would, we

think, soon convince those holding this opinion that such a plan could never work. Let us take a case. A competition is advertised for some hundred miles or so out of London. Would the living-at-a-distance competitors go to the expense of a journey and hotel expenses to view the designs for the purpose of recording their vote? Would it not further be open to the objection of votes being obtained by unfair means? Would not each voter be led to vote for his own design? Would those who were not able to attend, accept with equanimity the result of an election in which they were unable to participate with those who attended it? We think not.

It is well known in the profession that there is a large class of draughtsmen who almost solely subsist upon making designs for competitions. They know what will attract; they have great skill in making a taking design, and their sole chance of success lies in the draughtsmanship of the design. Of the ultimate cost, of good construction and of plan, they are too often shamefully ignorant.

It is not to be wondered at, however, that men unaccustomed to architectural drawings are at once taken by the pictorial effect of this kind of meretricious design. So it often happens that one is chosen, grossly violating the published conditions, utterly impossible to execute for the stipulated outlay, probably ill adapted to the intended site, which very likely has never been inspected, or the surroundings of the new building considered. The design accepted, comes the invitation for tenders with the usual result, tenders largely in excess of the architect's estimate. It is then too late for the committee to reconsider their decision; the design has to be mercilessly cut down and shorn of its prettiness, walls and timber reduced to barely supporting strength, and in the end general dissatisfaction all round, and the work carried on with great friction, and more obloquy heaped upon a profession which the competition system, more than any others, has so lowered in public estimation.

Now it is too much to expect that the appointment of the professional assessor is going to put an end to all and every evil of the competition system. That is a position which the most ardent advocates of it never have assumed, and in their circular issued to the profession, and published in these columns, they especially guard themselves against such a foolish admission. But they say, and we think rightly, that it is on the whole the best—nay, we may add, the only fair course to adopt, both for promoters and for competitors.

If it became a recognised rule that there should be no competition without a professional assessor, one result would be that only works of a certain importance would ever be put to competition, as the cost of employing a professional man of established reputation would be prohibitive with only a small outlay to be expended. We do not hesitate, in the best interests of the profession, to say that it would be an unmixed good, saving much heart-burning, jealousies, and fostering of evils which now cling to the system. Something must be done if the profession is to be one to tempt the best men to enter it, and to maintain the high standard that it ought and might do, to check the reckless gambling which is now in our midst. Terms more and more dishonourable are being offered and scrambled for; works of from a thousand pounds are offered for competition at a ridiculously low offer of remuneration; signs are not wanting that private individuals, seeing that architects will stoop to accept any terms, are also throwing their work to competition, in the hope of getting it done cheaper, and knowing full well that the bait will be snapped up. Men, in their desire to get work—honestly, if they can, but to get work—are ready to accept what may be offered, and the result, if this state of things go on, must be a still lower rate of payment, which at the best only offers now a moderate income even to a man in fair practice. Men are valued according to the estimate they set on their labour, and the estimate in which the public hold many men in the profession is low enough now, and needs no further encouragement.

Now, taking no Utopian view of the value of employing a professional assessor, let us consider some of the advantages. The man who would likely be employed would be one of judicial mind who had devoted years of study to his profession; his eye trained to detect the merits and demerits of a design, and quick to detect, knowing the conditions, whether a plan was workable or not; whether the building before him on paper would be suitable when erected, whether it could be executed within a reasonable margin for the estimate given.

He would at once see whether the construction was as a whole good. A design merely got up for effect would, before a critical eye, stand condemned: mere draughtsmanship would stand no chance. A design in direct violation of the conditions, or with any dishonest attempt to evade them, would be rejected. Is not such a man more likely to arrive at a righteous judgment than a committee, however upright and willing to do justice? We do not suppose that the verdict of such a man will not sometimes be open to question. Human infallibility is impossible; but we do say that such adjudication, or such advice as he alone can give a committee, is far better than the lottery of leaving it to the unaided judgment of the promoters.

Have not the columns of this and other professional journals teemed with complaints of the unfairness, the bribery, the favouritism, and other evils under the old system? The profession has the solution of the matter in their own hands to a much larger extent than at first sight appears. We do not advocate the competition system at all; it exists and must in some form or other be endured, dislike it as we may, but let it exist at least on the best basis possible. The assessor will uphold the honour and dignity of a profession which should be one of the most honourable; he will endeavour to maintain a fair standard of payment for fair skill and work; he will promote good architecture, and encourage honest and zealous men to come to the front; he will discourage paper architects, whose only qualification it is that they can make showy and meretricious drawings.

An objection frequently raised against the employment of an assessor is, that he will be biassed in his judgment; that before a Classic man Gothic would have little chance, or before a Gothic man Classic would go to the wall. All men have their predilections of style, and there is ground for the objections raised on this score; but we venture to think that the case is not sufficiently proven, and that a man sitting as judge, with the eyes of the profession upon him, would endeavour to give a righteous judgment apart from his own individual preferences. No doubt great discrimination should be exercised, and the fittest man chosen for the post that it is possible to obtain. Not only questions of style have to be considered, but questions of special skill in adjudicating upon the class of building proposed to be erected. There need, we think, be no very great difficulty about this. Accept the principle that a specialist should be appointed, and the best man for the building to be erected can easily be found, whose class of practice would enable him to speak with authority. That the appointment should be made as an initial step is, we think, most desirable, so that, knowing the wants of the promoters, he may frame the conditions and consult with those who call in his advice. We observe that in the circular to be sent by the Competitions Memorial Committee to promoters, they do not undertake to advise them on the selection of an assessor or assessors, but wisely refer them to the President and Council of the Royal Institute of British Architects, or to any well-known man not necessarily a member of that body. It should not, therefore, we think, be difficult for promoters to gain the services of a competent man for the particular work contemplated. If the profession at large, in their best interests, support the scheme, which has gained the adherence of some of the best men in their ranks, reform will be possible and much good spring from it.

## STUDIOS IN ROME: SIGNOR G. COSTA'S.

[BY A CORRESPONDENT.]

**S**IGNOR COSTA'S name is not unfamiliar to English art-lovers. His works have been shown from time to time at Burlington House, and he has been a contributor to the exhibitions of the Grosvenor Gallery since its opening; also in 1882 there was a special exhibition of his works in London. He is one of the few Italian painters who have broken free from the influence of national modes and forms, and has asserted his personality in new and self-appointed ways, with an individuality of character and a sincerity of purpose which in themselves command respect. There is, however, something more in his work than originality of conception and independence of treatment merely as such. It is thoughtful, earnest, and conscientious; and if not distinguished by that brilliancy of execution which in the first instance strikes the

eye by its splendour, it does not the less affect the mind dwelling upon it by its sober reticence, its well-digested faithfulness of reproduction, and a certain imaginative glow which satisfies the interior sense with the feeling of what is essentially tender and beautiful.

Italian art is at present in a somewhat anomalous position. It has lost the old traditions without introducing anything stable and satisfactory in the place of them. One cannot imagine a greater contrast in the selection of subjects and the mode of dealing with them than is shown in the works of former days and those furnished to us now. The fine, puristic sentiment of the Umbrians, the glory and richness of the Venetians, the intellectual power and academic perfection of the Roman and Florentine schools, have all vanished as art influences, leaving no trace or tradition behind. Another sentiment now rules everywhere, partly the outgrowth of Spanish examples inaugurated by FORTUNI, partly resulting from the desire to attract the eye by vivid colours and strong contrasts united with great cleverness of technical manipulation, but almost entirely wanting in those higher qualities of mind and of soul which are necessary to create and retain an interest in all artistic work calculated to take its place in the æsthetic culture of the time. In modern Italian pictures one too often finds forced and exaggerated sentiment, if the subject be a dramatic one, generally involving some circumstance of blood, intrigue, or horror; or a motive so trivial and silly as to be unworthy of notice. Should the subject be landscape one gets an extravagance of treatment which borders upon the meretricious. There is little that is sweet, wholesome, and unaffected. Amongst this little, however, must be placed the works of Signor COSTA. Whether in the figure, with which he sometimes deals, or in landscape, where his chief forte lies, he has taken the simplicities of nature, and by a fine, artistic perception has impressed upon them his individuality without obliterating or losing sight of their intrinsic qualities. The friend of our English MASON, in earlier times, he has never lost sight of his influence. To Sir FREDERICK LEIGHTON, too, we must accredit him indebted for a certain breadth of view and largeness of style—qualities which characterise the work of the President of the Royal Academy. Doubtless these painters also received a reactionary influence from their Italian professional brother, who is no mere copyist or slavish follower of the modes of others. From these observations it will be seen that Signor COSTA appeals to a northern rather than to a southern public, and to them he must look for a fair appreciation of his studies and labours.

Of Signor COSTA'S more recent works we have two painted for Mr. G. HOWARD. In the one is represented the Ponte Nomentano, a bridge which crosses the Anio two miles from Rome, seen under the effect of a sunset sky. A sober stretch of the Campagna is streaked by the waters of the overflowing river. The landscape is marked by a tree and two figures. In the distance the Tusculan Hills are seen. The other, the Bocca d'Arno, represents a reach of the Arno near its mouth below Pisa, flanked by some fishermen's huts. On the spreading shore two figures recline. Above the further bank the moon rises beyond the distant mountains. The effect is broad, serious, and impressive. Another is a landscape taken at Asciano. It is composed of the spur of a hill, at the foot of which are some sheep feeding. A small chapel occupies a part of the foreground, from which an expansive, rural, middle distance leads the eye to the far-off blue mountains which limit the horizon. This is painted with Signor COSTA'S usual care and thoughtfulness; but the subject is a little wanting in interest, which induces a tendency to monotony in the general effect. We have next two little pictures representing respectively Monte Oreste and Monte Circeo. The first of these, the well-known Mount Soracte of the ancients, is taken from the Villa Borghese. Above the trees, stripped of their summer foliage, the classic peaks of the mountain rise in distant blueness. The values of this picture are carefully rendered under a somewhat cold light. The other represents the Circæan Promontory, the appearance of which is familiar to travellers along the Mediterranean coast of Central Italy. The huge headland rises in faint grey from a well-studied and carefully-painted stretch of sea. It appears like an island from a little distance, the low-lying connection with the mainland not being visible. Thus it is rendered by Signor COSTA, a line of fishing-boats with lateen sails passing under the promontory. Signor COSTA'S largest picture of this year is *Spring on the Celian Hill*. The foreground is occupied by orchard gardens, in which are some

almond-trees in blossom. The sculptured figures which surmount the façade of St. John Lateran stand in the middle distance. Farthest of all are seen the Sabine Hills. This picture is painted in a series of well-balanced greys varying from neutral to more positive tints. In spite of the refinement and delicacy displayed in the manipulation, one feels that it might have borne a somewhat richer and fuller treatment. In his *Evening Repose* a peasant woman is seated on a wall, a mattock and sickle lying on the ground. The figure occupies a large proportion of the picture. A flush of dying light fills the sky. The landscape is serious, simple, and broad, and reminds one, in its well-balanced sweetness, of the French MILLET. Porto d'Anzio, the site of the ancient seaport Antium, is favourite art-ground of Signor COSTA. His fine picture of a dreary coast scene in this district has been exhibited in England. Amongst other studies and pictures from the same region we have the mansion of the BORGHESE family on its wooded height overlooking the sea, a glimpse of which is seen in the distance. Another, also taken in the same locality, gives us the old town Nettuno, with its forlorn and very picturesque-looking castle on the sea-border. Rising out of the dreary waters are seen the ruins of the old military port of NERO. The Pontine Marshes bound the sea on its farthest side, beyond which rises the Volscian range. Certainly Signor COSTA conveys the gloom and eerie desolation of this spot as no one else has done. One almost feels the pervading melancholy with which its very winds seem to be charged, as of a funereal spirit mourning its departed greatness. Scarcely less sombre are the passages of landscape taken from Gombo, near the mouth of the Arno, of which we have several. One of these is peculiarly refined and harmonious. Groups of pines, near and more distant, rise from a shadow-streaked sward here and there bristled with rushes. Over these a soft golden light is diffused, which one might imagine to be engaged in loving play with the tender shadows, so sweetly are they blended and interwoven. A woman ties up a bundle of sticks in the foreground. In this picture the painter has realised his happiest mood, and well expressed his feeling for one of those subtle and enchanting effects of nature, the contemplation of which acts upon the mind like a sedative. On a broad and low canvas we have a representation of some Tuscan vineyards underneath Vallombrosa, in the season of autumn. In the extreme distance the Carrara mountains lift themselves above the horizon, all sobered under the gathering twilight. Although not finished, this promises well.

Signor COSTA has not wholly confined himself in his choice of subjects to Italian soil. He has given us some remarkable interpretations of English landscape and scenery. They have much of the freshness and open-air look of DAVID COX's landscape studies, reminding one also, to a certain extent, of some of CONSTABLE's crisp and sparkling transcripts; and, though they cannot lay claim to the full vigour and frankness of these masters of the brush, yet they compensate in a measure for their brusque qualities by careful study and thorough artistic finish—a study and finish which never become oppressive or distracting. Amongst these is a landscape in Cumberland, a fresh green English pastoral, with a harmonious sweep of line characteristic of the district. Some beeches in the foreground throw their shadows on the sward. A wooded upland is seen in the distance. The picture is agreeable and pleasing. Another, of a somewhat similar subject, gives us a pasture flanked by a bit of woodland. A broken middle distance leads the eye to a stretch of blue heath. A mottled sky suggests the smiles and storms of changeable weather. Discarding all meretricious attempts to attract the eye, this picture is distinguished by a repose of treatment which it is refreshing to look upon. Another characteristic piece of English landscape on the borders of the Lake district, represents a heath-patched dingle with a beck running through it. A distant hill lifts its shoulder over the boundaries of this little nook, over which hangs a threatening sky.

But it is not only as a landscape painter that Signor COSTA shines. He has painted some heads and figures of rare excellence, first of which may be mentioned a quarter-length portrait of his own daughter. It is designed and painted from a thoroughly artistic point of view. She is clothed in a blue-grey velvet dress, with a lace frontlet—a sweet girlish face which fixes itself on the memory. She looks out of the picture with an earnest childlike gaze, the hair streaming on each side of the face. The tender manipulation, the fine

neutrality of colour and equality of tone in this picture give it a high place in this branch of art. Another portrait is that of a nephew, hardly less excellent, but in a different key and sentiment. He is seated with some flowers hanging from his hand. It is as sweet and unaffected as if it had been painted by JOHN BELLINI, and would, indeed, hold its own beside the works of that master. Other figure pictures represent a girl of Lerici, seated with her back to the spectator, looking over her shoulder, and a careful and refined study of a girl descending some steps with a well-poised pail on her head. She stands firm and strong as a caryatid, a fine example of the higher type of Italian physique.

On the whole, we leave the studio of Signor COSTA impressed by the work of a refined and artistic mind, poetic in the truth and simplicities of nature, and indicating an eminent position for the art of his country, if it could only be looked upon as an influence having a bearing on the aims and works of his compatriots.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE twelfth and last ordinary meeting of the session was held on Monday evening, Mr. Ewan Christian, president, in the chair. A vote of thanks was passed to the various gentlemen whose donations of books to the library were announced.

Mr. MACVICAR ANDERSON stated that the Architectural Conference to be held at the Health Exhibition had been postponed from June 23 to July 10, 11, and 12.

A ballot then took place, and the following gentlemen were elected:—

*Fellows.*—Messrs. Arthur Ebdon Johnson (Melbourne), Philip M. Dudgeon (Natal, South Africa), Thomas Rowe (Sydney), President of the Institute of Architects of New South Wales), Thomas Searancke Archer, Thomas Lennox Watson, and Frederick Wheeler.

*Associates.*—Messrs. Alexander Brown Wilson (Brisbane), Charles Mason, James Anderson Williamson, John Bevan Phillips, Joseph Addenbrooke Saunders, John Moir Kennard, Hedley John Price, Frederick Jones Banister, Lionel Thomas Waller, Andrew Whitford Anderson, Robert John Beale, Alexander McGibbon, Richard Malone Hamilton (New Zealand), Arthur Crow, Thomas Frederick Pennington, William Henry Radford, Assoc. M. Inst. C.E., and Samuel Hurst Seager (New Zealand).

*Honorary Associate.*—Mr. Charles Bell Birch, A.R.A. Monsieur Alfred Nicolas Normand, Paris, was elected Hon. Corr. Member by acclamation.

The following gentlemen, it was announced, had ceased to be members of the Institute:—Messrs. D. J. Coakley, of Cork, W. H. Hoskins, G. S. Rees, Rollitt Stockton, and Sydney Turner.

### The Royal Gold Medal.

The PRESIDENT: Gentlemen,—You are of course aware that at this, the concluding evening meeting of the session, it is usual to present the Royal gold medal to the person selected for that honour, approved by yourselves and by Her Majesty the Queen, in whose name it is given. You are also aware that this year the choice has fallen on Mr. Butterfield, but many of you may possibly not know, and it is therefore right I should explain, that while thankfully accepting the proffered honour, Mr. Butterfield said that it would be so inconsistent with the habits of his whole life to appear in person publicly to receive it, that, if it were a necessity, he must regretfully decline. Considering that personal appearance had in other cases been dispensed with, the Council were of opinion that this difficulty need not bar their decision as to the man. I thought it my duty, however, to represent to him how much we should like to have welcomed him here, though I confess to having much sympathy with his feelings in the matter. I know no man whose whole career has been more truly honourable, or anyone whose work as an architect has been more thoroughly consistent with the quiet dignity so characteristic of his life. In the great movement for the revival of Gothic architecture there have been, amongst others less pronounced, at least two types of men who have achieved eminence as practising architects. The prominent leaders of the cause were of great mental and physical power, indomitable energy, and restless love of work, and could not fail to attract general and popular attention; but not less important to the success of such a movement have been the quiet, studious hard workers, who in parallel lines have done so much to advance the knowledge and sound practice of their art. Of the former type two have accepted this medal, and, to our sorrow, have successively passed away to their rest. Of the latter, one has received it and is with us; but the roll of gold medallists would indeed have been incomplete had it lacked the name of William Butterfield. In him we must all recognise a true master of his craft; one who not only knows well the art he practises, but whose works from first to last, whether great or small, in the country or in

the cities, bear the uniform impress not only of skilful design but of the loving care with which they have been carried out. I hope I may count upon your sympathy in saying what I often think, that the world at large shows too little gratitude to those who minister to its improvement or its pleasure. Just as I think the poet, the great writer, the musician, the painter, should be thanked for the gratification and instruction which each in his own vocation affords, so no less should the great architect; yet who ever thinks of giving him his proper meed of praise? Who ever thanked Sir Christopher Wren for his noble works in the city of London, the churches, towers, and spires with which he beautified it, or the magnificent cathedral, with its glorious dome, its crowning glory? We know too well how the great architect's last days were embittered by the persecutions of men in office not worthy to tie the shoe-strings of the master; yet what a poor, mean place would London have been but for the working of his fine and cultivated genius. Many times have I wished that I might have met in Palace Yard and thanked Sir Charles Barry for his noble clock tower, and of many another work I could probably say the same. Truly, I think, if any man earns the gratitude of nations it is the great architect, whose works are for all time an honour to his country; visible to anyone who takes the trouble to see, or has the mind to appreciate the beautiful in art; and for this reason I think we have done well in offering to Mr. Butterfield the greatest honour it is in the power of the Institute to bestow. If it be true, as I hold with the poet it is, that "a thing of beauty is a joy for ever; its loveliness increases, it will never pass into nothingness," then I think we may joyfully thank Mr. Butterfield for the dignified work of his early years; the graceful and beautiful spire, and the vigorous, yet sumptuous, interior of his noble church of All Saints, Margaret Street; and lest I should weary you by a bare recital of his works, passing over many others, each possessed of the power and beautiful form of which he is so great a master; glancing only at the noble church of St. Alban, of the fine, west front of which, as has been well remarked, there was lately an unlooked for revelation; and the fine church of St. Augustine, South Kensington, I will stop at the great crowning work of his maturer years, the magnificent and richly-finished chapel of Keble College, Oxford. In each and every one of these is seen, though with great variety of composition, the same noble conception of dignified form, the same careful study of every detail for producing general harmony of work, and, while fully availing himself of the richness derivable from the subsidiary arts in choice stained glass, mural painting, or mosaics, the same powerful mastery which fuses the whole and subordinates everything to the architect's design. While possessing, as he does, a profound knowledge of the works of the great architects of old, and availing himself of the numberless resources which they so copiously afford, Mr. Butterfield's genius has enabled him to work in a style peculiarly his own, never slavishly copying, but moulding in his own mind whatever he desired to employ in carrying out his work; and though opinions may and will differ on matters of taste, none can certainly deny that his works are those of a refined and cultivated gentleman and a most able, original, and accomplished architect. Finally, gentlemen, I think I have said enough to show that our medal has been worthily bestowed, and I trust I have not wearied you in dilating possibly too long on what has been to myself a very genial theme.

The President then presented the Royal gold medal, this year given to Mr. William Butterfield, to Mr. Penrose, who attended on the part of Mr. Butterfield.

Mr. PENROSE said that, under the circumstances, he had no occasion to say much. He considered a great honour had been conferred on him in making him the medium to convey the gift of the gold medal to Mr. Butterfield, and he should endeavour as soon as possible to acquaint Mr. Butterfield with the President's remarks and the enthusiasm with which those remarks had been received.

#### Medals and Prizes.

The President then distributed the medals and prizes as follows:—

The Soane Medallion, with fifty pounds, was awarded to Mr. John Oliver Harris; and in the same competition a Medal of Merit was awarded to Mr. Herbert Osborn Creswell.

The Tite Prize of thirty pounds was awarded to Mr. Edwin William Poley, Associate; and a Medal of Merit and ten guineas were awarded to Mr. John Archibald Campbell.

The Institute Silver Medal and ten guineas for measured drawings was awarded to Mr. Andrew Whitford Anderson, Associate.

A similar Institute Silver Medal for measured drawings was awarded to Mr. Arthur Needham Wilson, a Medal of Merit to Mr. John Robert Sutton, and Certificates of Honour to Mr. Arnold Bidlake Mitchell and Mr. Henry Downs.

The Institute Silver Medal and ten guineas (Essay Prize) were awarded to Mr. Thomas Purves Marwick, Associate (the first Ashpitel prizeman in the obligatory examination).

Mr. J. T. WOOD, F.S.A., then read a paper on the

#### Temple of Diana at Ephesus.

Mr. WOOD began his paper with a general statement of the question between Mr. Fergusson's restoration of the Temple of

Diana at Ephesus and his own. So material was the difference between them that he had felt bound to submit to the judgment of the Institute both plans drawn to the same scale, but in no spirit of antagonism. When in 1863 he set himself to unearth this glorious building, which was reckoned one of the Seven Wonders of the World, he had not forgotten to study beforehand the few ancient authorities on the subject, especially Pliny, in whom, considering that the Roman writer never saw it, Mr. Fergusson, strangely enough, so implicitly confided. Clearly we must reject any of the dimensions given by Pliny which were found irreconcilable with the data acquired by excavations. By this rule Pliny's figures for the width of the temple platform were condemned as inexact. The true width was 239 feet 4½ inches. But Pliny's 425 Greek feet for the length was borne out by the excavations. Mr. Wood thus got, he said, ample space for one or more altars, as well as for marshalling such processions as that described in an inscription found in the Great Theatre. Mr. Fergusson suggested an arrangement of the steps in broad and narrow flights, which Mr. Wood argued, was inadmissible. It was further shown how in the investigation of these and other details, he was brought into contact with the *débris* of every one of the three successive temples which had occupied the site. The earliest of the three was that begun towards the middle of the sixth century before the Christian era, under the architects Chersiphron and his son Metagenes, and to which the Lydian King Croesus so liberally contributed. This temple appeared to have been adorned with sculptured columns, as fragments of archaic bas-reliefs attached to a rounded surface were found on the site, and were now to be seen in the Archaic Room at the British Museum. A large lion's head, and some other fragments of antique sculpture, found in some foundation piers of a later age, must have come from the earliest of these three temples. The second temple was begun in the early years of the fourth century by the architect Paionios. The last temple was begun in the time of Alexander the Great, and must have been already far advanced when he came to Ephesus, since he proposed that he should be allowed to dedicate it to the goddess in his own name. Mr. Wood said he had ventured to place two altars on the platform at the western end, one for animal sacrifices, and the other for such offerings as the fruits of the earth. In his account of the *cultus* of the moon-goddess, to whom, as well as to her brother, the sun-god, human victims were anciently sacrificed, Mr. Wood was largely indebted to the erudition of Professor Paley, who thought that the great statue must have been hypæthral, because it was an object to let the moon shine straight upon it, and that it would stand close to, and as it were, preside over the principal altar. Mr. Wood mentioned a suggestion of his own in conversation with Mr. Fergusson as to the hypæthron, that these openings in the roofs of temples harmonised well with the ancient Greek belief that the gods floated in the air, and would at times descend thereby into their temples. Mr. Fergusson's reply was, "Let them walk in at the door like other people." Mr. Wood next pointed out the monumental verifications of his views as to the width of the temple itself and to the position he had assigned to the columns. He explained why he had not felt at liberty to make such a restoration of the temple as would better satisfy the desires of those who, with good reason, imagined that groups of sculptures, bas-reliefs and statues, in addition to the sculptured columns or frieze, were needed to account for the lavish admiration bestowed upon this world's marvel by the ancient writers. He stood in awe of the peril of dwarfing the grandeur of the building. He had, however, ventured to put statues on pedestals against the cella walls. One of the most important points of difference between Mr. Fergusson and himself was in respect of the number of external columns. He accordingly vindicated his own punctuation and rendering of the Plinian text—"One hundred columns, twenty-seven the gifts of kings." This, he contended, was more correct than the removal of the comma, and making Pliny say there were "One hundred and twenty-seven columns the gifts of kings," as Mr. Fergusson did. Room had been found for 100 columns, but not for more, and if there had been 127 they could not all have been given by kings. Rich private individuals and communities would give some, and he himself happened to find part of the base of a column, showing that it had been given by a Sardian lady. The most interesting feature of the temple must have been the sculptured columns, 36 in number. To an account of these, of the temple volutes and architraves, as also of its cymatium and marble roofs, the remainder of the paper was devoted.

Mr. JAMES FERGUSSON, who was unable personally to attend, sent the following reply to Mr. Wood's paper, which was read to the meeting:—"In the first place I object *in toto* to his arbitrary insertion of a comma, where none exists, into a singularly plain sentence of Pliny's works, which alters its sense entirely, and so far as I can see, makes it read very like nonsense. As it stands in the text it simply says: 'There are 127 columns' (in the peristyle of the temple) 'the gift of several kings.' Alexander offered to give the whole if allowed to dedicate the temple to the goddess in his own name. His offer was rejected, but other donors, not necessarily kings, as we understand the term, supplied his place, each giving according to his ability. Of course, when a

sentence seems perfectly inexplicable, or at variance with facts ascertained in excavations, the insertion of commas, and stops, or even alterations of the text, are allowable, but only as temporary suggestions to get over what appear to be insuperable difficulties. When, however, it dawned upon me that thrice nine made twenty-seven, and when on protracting them I found that nine pillars, with the usual intercolumniations of 19 feet 4 inches made up the same dimension that was occupied by the widely-spaced eight columns of the front, the riddle was guessed and the problem solved. When worked out, as shown in the plan published in your Transactions, it was found that not only did every dimension quoted by Pliny come out exactly correct, but every paragraph bearing on the subject in Pliny, Pausanias, Strabo, or any author in ancient times was verified and confirmed. The only wonder to me is that Mr. Wood did not at once adopt this suggestion, which got him not only out of his translation difficulties, but rendered the temple he had discovered with such infinite labour so much more worthy of the character for magnificence which it bore throughout the ancient world. Instead of this, he adheres to a plan in which only one dimension comes out correct, and that not ascertained by excavations, but adopted from Pliny. In the only plan he has yet published, it is quoted as 418 feet  $1\frac{1}{2}$  inches, as ascertained by excavation; he now adopts 425 Greek feet (430 English), which is the dimension for the length given by Pliny. It is strange that while Mr. Wood will not allow that this author could count the columns, which were then all standing, and their number a matter of notoriety known to all the world, he should admit that he could measure the length of the temple, a very much more difficult operation, to within one foot, though he failed, according to Mr. Wood, to ascertain the breadth, 220 Greek feet, which, being about half the other, was certainly an easier operation. Not only did the adoption of 127 columns get over all the difficulties regarding the dimensions quoted by Pliny, but the very much more serious one that all antiquity declared the temple at Ephesus to be the largest as well as the richest in all Asia. Pausanias, for instance, says (book vii., chap. v.) that it is larger than that at Didyme, whose dimensions are perfectly well known. It had 120 columns 64 feet in height, while Mr. Wood represents that at Ephesus as possessing only 100 columns, and their height at only 55 feet 8 inches—a fact which, it seems to me, is quite sufficient in itself to settle the question. One of the arguments on which Mr. Wood insists is that he found a six-foot length of the lowest step of the podium in such a position that there is no room for my 127 columns. There may be fifty ways of accounting for such a trifling fact, but that I have suggested in my paper is quite sufficient. Strabo's account of the addition made to the temple after it was finished by Chersiphron not only suggests, but seems to require, such a buried step. But I do not see that Mr. Wood has turned his attention to this, or attempted to explain the passage otherwise. In fact, the Institute have now before them two plans of this famous temple, one of which professes to explain every dimension handed down from antiquity, and to reconcile them with every discovery Mr. Wood made on the site, and to offer a reasonable explanation of every fact mentioned by any ancient author; the other does not pretend to agree with any passage in any writer of antiquity, except by a forced and most dubious mode of interpretation, nor to agree with any one dimension given, except one which was not ascertained by excavation; while from the smallness of its dimensions it contradicts all history. I cannot quite make out whether Mr. Wood still adheres to his theory that the heavy blocks carved on two faces are parts of the frieze of the temple, or are square pedestals of certain of the pillars, as I suppose; but as the blocks are now arranged in the Ephesian Gallery of the British Museum any architect can judge for himself, and I shall be excessively surprised if anyone agrees with him. In the meanwhile it would assist materially in settling the question if he would let us know where they were found. As there are certainly four, probably five, of them, they must, if parts of the frieze, have been found near the four angles of the temple. As far as I can make out from his published work, this was not the case. When he puts into tangible form his ideas of the hypæthron, it will be time enough to consider them. Till he does I can only say—with all due deference to the learning of Professor Paley—that those expressed in this paper appear to me only as examples of a hazy mysticism which I am astonished that any practical architect should adopt."

Some remarks were then made by Mr. Penrose and Mr. Popplewell Pullan, and shortly after the proceedings terminated.

### EARLY SYMBOLISM.

A PAPER, entitled "Notes on Early Christian Symbolism," was read at the concluding meeting of the Society of Antiquaries of Scotland on Monday by Mr. J. Romilly Allen. After indicating the extent and variety of the general subject, the author proceeded to deal with that special branch of it which includes the representations sculptured on the fonts, tympana of doorways, and other carved stonework of the Norman period in Great Britain. He had chosen this particular class of remains partly because it

followed directly in order of time upon the early sculptured stones of Scotland, and thus threw light on the meaning of the earlier system of symbolism, and partly because these sculptures of the Norman period had a story of their own to tell which was fraught with the very highest interest, if we could read it aright. After adverting to the changes in culture which continued to produce alterations in the expression of the symbolism, he proceeded to show that this change, though persistent, was only partial in its effect, for, although some symbols have been lost entirely, there were others which still remained the same as they were in the third century A.D. They had thus four classes of Christian symbols—(1) Those which had survived the effects of time, and were still used to express their original meaning; (2) Those which had ceased to be used both in this country and elsewhere, but whose significance was known historically or by inscriptions upon the objects themselves; (3) Those which, though they had disappeared in this country, were still in use elsewhere; and (4) Those which had ceased to be used in this country and everywhere else, and of whose significance nothing was known, either from history or from inscriptions. Having enumerated the chief sources of the materials for the study of early Christian art from the third to the thirteenth centuries which have been fully explored, he referred to the almost inexhaustible stores of sacred and legendary art in the MSS. in the British Museum, which were still untouched, while the sculptures found in connection with our ancient cathedrals and churches had never been dealt with systematically. As showing what ample material there was to form a museum of Christian archæology, by having casts taken of these sculptured fonts, tympana, &c., so that they might be placed together in one gallery, as thus alone could they be made to yield whatever scientific results were attainable from them, he gave a list, classified by subjects and localities, of upwards of 120 tympana, eighty fonts, and thirty pieces of miscellaneous sculpture. As far as actual execution was concerned many of these early Christian works of art were rude in comparison with the best examples of Classic art, but in almost all cases the ideas which inspired the Christian sculptor were purer and nobler than those of Pagan times, and they were expressed with a vigour which was often wanting in more refined productions of a higher artistic culture. The sculptured Celtic slabs and crosses of Great Britain were the next oldest source of early Christian art to the catacombs of Rome, and by a systematic comparison of their symbolism with that which preceded and followed it, he was not without hope that some of the problems which had so long baffled the research of archæologists might thus be elucidated. The paper was illustrated by a series of drawings and photographs of the principal types of the symbolic representations on Norman fonts and tympana.

### ARSENICAL PIGMENTS IN MURAL DECORATION.\*

THE subject of the contamination of mural decoration with poisonous pigments is by no means a new one. It is known that wall-papers, wall-washes, and distempers may be so impregnated with arsenic as to cause not only serious illness, but even death; and that curtains, carpets, and dress fabrics have in a similar way proved subtle danger to health. Dr. Kirchgässer, of Coblenz, in 1867, investigated cases of poisoning by green wall pigments, and published twenty-one cases, describing their effects. The well-known publications of Mr. Henry Carr, C.E., containing a complete summary of the subject, have drawn attention to the evil in our own country. The Medical Society of London issued a circular containing a number of queries to medical men, and, through Mr. Malcolm Morris, secretary to the committee, issued a report (February 1880) based upon 244 replies, embodying information with illustrative cases. A committee of the Society of Arts have strenuously endeavoured to obtain legislation to prohibit the sale and use of arsenical colours, but their efforts have so far failed. In June 1883 a "Report on Evidence regarding the Injurious Effects on Health arising from Arsenical Wall-papers and other articles" was issued by Dr. Lauder Brunton, on behalf of the National Health Society, containing instructions for the application of standard tests. This society is now trying to draft a Bill for Parliament, directed against the indiscriminate sale of poisonous pigments.

The Scheele's, emerald, or Schweinfürth green consists of copper acetate and arsenite, and contains as much as 59 per cent. of arsenic if unglazed papers composed of it be scraped; but it is now well ascertained that colour is no guide whatever to freedom from arsenic. As examples in my possession show, almost any tint may be more or less impregnated—viz., reds, browns, French greys, neutral blues, greens, and even French white. Arsenious acid is also largely employed in the manufacture of aniline colours—e.g., magenta, rosaniline, fuschine—and though it only should be

\* From a lecture delivered to the Leeds Architectural Association, by Mr. Charles J. Wright, M.R.C.S. Eng., Senior Surgeon to the Leeds Public Dispensary, &c.

used for "fixing" the colour, it is not always got rid of in the finished goods. In manufactories where arsenical colours are used at all, probably all papers will get to some extent contaminated. Manufacturers are now fully alive to the danger of using these colours, and some firms have for long been in the habit of guaranteeing their papers as free from arsenic. I am indebted to Messrs. Cooke & Co., of Leeds, and to Messrs. Woollams & Co., of London, for the beautiful specimens exhibited in order to show how good colours of every variety, and of good body, permanency, and brilliancy, may be produced, at least in all the better class papers, without the aid of any arsenical pigment whatever.

The size with which the colours are mixed before printing used to be impregnated with arsenic, which was added on account of its antiseptic properties. The fact of size being now supplied free from fatty matters renders this addition unnecessary. The paste too with which the paper is laid on may have contained arsenic (as a preservative); hence the double necessity of being careful to strip off all old papers from a wall before putting up a new one.

It has been suggested that, in order to provide against accidental and unavoidable contamination, there should be in any legal prohibition an allowance of half a grain of arsenic per "piece of paper," a piece being 12 yards long by 21 inches wide. This quantity, it is thought, would not be injurious to health. It is found that a suitable size for testing is 16 square inches—viz., 4 inches by 4 inches. The above allowance of half a grain per piece gives '001 grain per sample of 16 square inches—a quantity more than four times the amount which would be permitted by the decree which exists in Sweden. The proportion of arsenic in paperhangings has often been found to range as high as 40 to 50 grains in the square foot of the paper, frequently reaching 10 grains to the square foot. A large-sized room has about 1,000 square feet of wall surface after allowing for windows, doors, fireplace, &c., so that the amount of poisonous pigment exposed to chemical action may be enormous.

There seems to be no reason why good colours should not be produced without the use of arsenic, and no appreciable difference in the cost of production of non-arsenical colours, at least in the better-class papers, exists. It appears, therefore, that the evil effects due to poisonous mural decoration only require to be more widely known in order that the manufacture of non-arsenical papers may become universal. These effects have now been observed in a large number of cases, and have been tabulated by Mr. Malcolm Morris according to the parts affected, and according to frequency of occurrence as follows:—

1. *The Stomach and Bowels.*—Diarrhœa and dysentery, nausea and vomiting, loss of appetite, thirst.
2. *The Eyes.*—Conjunctivitis and sore lids.
3. *The Nervous System.*—Depression of spirits, restlessness, sleeplessness, headache.
4. *The Throat, Nose, and Respiratory Organs.*—Soreness of throat, ulceration and dryness, bronchial catarrh, asthma, symptoms like ordinary cold in the head, with running of tears.

The following cases are illustrative of some of the above symptoms:—

*Case I.*—A gentleman entered a new house and slept in a bedroom formerly used only occasionally as a spare room. He suffered from headache, sleeplessness or unrefreshed sleep, sore throat, depression of spirits and malaise. On stripping the wall several layers of paper were found, that on the surface being loaded with arsenic (specimen shown). The walls were entirely cleared, and the above symptoms disappeared.

*Case II.*—A boy suffered from persistent mucous diarrhœa; afterwards the same boy and his father from ulceration of the mouth, which was very intractable. The nursery paper (piece shown) was found to be highly arsenical. This was removed, and all trouble subsided. Obstinate skin affections, troublesome eruptions and continued boils have also been traced to the same causes. The effects of arsenical colours upon the eyes were long ago pointed out by Mr. Jabez Hogg and others, and are still not unfrequently observed (specimen shown). Cases have occurred also where even fatal consequences have resulted. Out of 102 cases of arsenical paper poisoning collected by the committee of the Medical Society of London, six were fatal. The following case occurred in my practice since the above were tabulated:—A man, æt. forty-six, suffered from jaundice, sickness, pain in the abdomen, obstinate cough, a scaly condition of the skin, with much itching. He was intensely anæmic, lost strength, and died after several months of increasing weakness. The sitting-room of his house was washed over annually with a green powder (sample shown), which was kindly analysed for me by Mr. R. Reynolds. He reported it to consist of "chalk highly coloured with arsenite of copper," the "amount of poisonous material being simply enormous." This was only discovered a short time before his death, which was attributed to the poison in the absence of other cause also by Dr. Clifford Allbutt, F.R.S., who saw the case with me. Distinct traces of arsenic were found in the excretions by Professor Thorpe, F.R.S., who kindly analysed them for me.

The form and mode in which arsenic from pigments attacks the system may not always be the same. It is well known that arsenious acid vaporises at a comparatively low temperature, and that all poisons have a fearfully increased potency in the gaseous

shape. A few hundredths of a grain of arsenioretted hydrogen have proved fatal, for instance. Now, hydrogen is evolved during the growth of mould (Roscoe and Schorlemmer), and it is probable that the joint action of moisture and of organic matters—viz., of substances used in fixing to walls papers impregnated with arsenic—will result in the development of arsenioretted hydrogen (Fleck, of Dresden), especially if favoured by the heat produced by gas, intensified by want of proper ventilation. The dust collected from the tops of furniture contained in rooms papered with arsenical colour may, on analysis, yield much arsenic; but it is impossible that all the effects can be produced by simple mechanical detachment.

It does not follow, of course, that all who are exposed to the poisonous influence are necessarily affected. Sewer gas may similarly strike down only certain individuals unaccustomed to it. Infection may attack one child, another may escape. Like the ash-pit clearers and the opium eaters, many may acquire a similar tolerance of arsenic. I lived and worked for seven years in a consulting room covered with a paper which I afterwards found gave "ample evidence of the presence of arsenic," but, as Mr. Reynolds told me, it was "a paper of good quality, and the colour firmly fixed." Although I suffered from an illness, and sundry minor troubles during that period, to which the poison might, to some extent, have contributed, I could, I think, assign to them other more decided causes.

When we come to ask what are the legal restrictions upon the sale of arsenic in this country, we find that the Sale of Poisons Act, although guarding and limiting the sale of pure arsenic to a great extent, does not prohibit in any way the indiscriminate importation and distribution of arsenical and other poisonous pigments. The highly poisonous green wall-wash, which in my case proved fatal, I found any poor person unknown to the vendor—a highly-respectable druggist—might purchase in any quantity he or she desired without the slightest limitation.

The law protects the public from the adulteration of milk with water, though—as recent epidemics have shown—our sanitary authorities do not possess the power to prevent its adulteration with a concentrated solution of scarlatina or typhoid fever. We are still too liable—without due precaution—to be poisoned by our decorative surroundings. It is much to be regretted that we still differ from so many of our continental neighbours in that no enactment yet exists upon our Statute-book bearing upon the danger referred to. The National Health Society have taken the matter in hand. In response to a request through their chairman, Mr. Ernest Hart, a circular was last year addressed by Lord Granville to each of Her Majesty's representatives at foreign courts, requesting "information respecting the legislative or municipal enactments having for their object limitations, restrictions, or safeguards in the manufacture, use, or sale of arsenical and other poisonous colours in the tinting of wall-papers, and various textile fabrics for industrial and decorative purposes." The replies have recently been issued as a Parliamentary paper. The "correspondence" is full of interest, and shows that of the twenty-two States which have diplomatic relations with the Court of St. James's, only eight are in the position of England in this matter.

France, Belgium, Spain, Portugal, Greece, Italy, Switzerland, and the United States impose no restrictions; while in other countries—notably in Germany, Russia, and Sweden—the regulations are most stringent. In Germany, from whence most of the colours used in this country are imported, an Imperial order forbids the employment of colours prepared with arsenic in the manufacture of paperhangings. Any person who contravenes this order, or who attempts to do so, is punishable with imprisonment, and with penal servitude if "severe bodily damage or death results." Restrictive regulations having been found to operate disadvantageously on Prussian trade with foreign countries, an order was issued in 1854 permitting manufacturers to use arsenical colours for exportation only, provided all such colours were kept carefully separate from those for home use. "This order has, however," we are told, "been made but little use of"—happily so for us. In Russia home manufacture and importations of poisonous colours are prohibited, and detailed instructions for testing them are given.

Sweden possesses a most complete Royal decree, founded on elaborate reports of the Swedish Board of Medicine, the prohibitions applying specially to the importation of carpets impregnated with dangerous colours. Let us hope, then, that ere long the efforts of the National Health Society may succeed in obtaining some enactment whereby it will be rendered a punishable offence—I. For the paper-stainer to use pigments impregnated with arsenic in the manufacture of his goods; 2. For the retail dealer to supply such goods to his customers. Producer of colour, manufacturer and vendor of paper should all be compelled by law to guard themselves against any contamination at their own risk. How soon will our Legislature recognise the necessity for action? and still more to the point, How soon will it be possible to avail ourselves of the results of such action? Architects and doctors, in the aims and daily work of their respective callings, are so frequently brought more or less into association, that they might profitably combine to render any proposed measure thorough and efficient.

## NOTES AND COMMENTS.

A MEETING of the committee appointed to administer the Lord Mayor's Fund, for the relief of people who were sufferers by the recent earthquake in Essex, was held on Tuesday. It was reported that an examination had been made of 745 houses and cottages, 18 churches, 10 chapels, 11 schools, and 11 parsonages. In some cases it was resolved to pay the whole cost of the repairs out of the fund, and in others three-fourths, one-half, or one-fourth cost, according to the circumstances of the occupiers. By this arrangement 4,268*l.* will be appropriated. The cost of repairing the churches and chapels has been estimated at 4,041*l.* Already a sum of 9,900*l.* has been collected.

THE international exhibition which is to be opened at Antwerp on May 2, 1885, will embrace all industrial products, all goods forming objects of commercial transactions, and all objects and appliances of interest to navigation. The purpose of the enterprise is to favour and develop international exchanges. The executive committee appeal to all nations, and hope that by the number and merit of their exhibits, they will vie with each other to unite at Antwerp in 1885 an attractive collection of all the products that interest the commerce of the world. The principal building will be of large area, and will be constructed by the three greatest metallurgical establishments of Belgium. The executive committee are in a position to affirm that the whole of the works will be completed within the appointed time. The Belgian Government will take steps for the due protection of inventions, industrial designs, or models, as well as trade marks represented at the exhibition.

MANY of our readers will regret to read of the death of Mr. RIDGWAY K. LLOYD, of St. Albans. His contributions to archæological knowledge showed the results of well-directed studies carried on with ardour, not only among documents, but with constant reference to the actual buildings. The book on "St. Albans Abbey in the Year 1428" will be a lasting and pleasant memorial of his method, of his precision and love of detail, and at the same time of his capacity for taking general views and making deductions from analogy. Mr. RIDGWAY LLOYD had been for a number of years one of the honorary secretaries of the St. Albans Architectural and Archæological Society, and took an active part at its meetings, reading papers of great interest from time to time. To his personal friends his loss will be great. The town of St. Albans and the neighbourhood may be said to have gone into mourning for him. His very large practice as a surgeon had brought him into constant contact with all classes, and he was much esteemed and liked. His age was only forty-one years. Typhoid fever was the cause of his death.

ONE of the few instances in which as yet there appears to be any attempt to decorate the interior of the houses in the Old Street at the Health Exhibition in accordance with the exterior, is in the shop appropriated by the "Worshipful Company of Playing Card Makers." It has been fitted up roughly, but effectively, in a manner becoming the occasion, under the direction of Mr. LEWIS F. DAY. The treatment of the roof, with its simple emblematic decoration, and the frieze with its appropriate quotation from POPE's "Rape of the Lock," is at once quaint and decorative. In the central window occur the arms of the company executed in stained glass. The lower walls are to be furnished with a collection of ancient playing cards, arranged by Mr. O. CLULOW, a member of the court of the company.

THE financial success of the MEISSONIER exhibition has been gratifying to the artist as well as to all who are concerned in the Charitable Refuge. If the sum received on the opening day is included, the receipts for the first fortnight have amounted to 55,184 frs. The charge for admission is 2 frs. on weekdays and 1 fr. on Sundays.

IN accordance with the report of the Minister of Public Instruction and Fine Arts, the Municipal Art School at Aubusson (Creuze) has been recognised as a national establishment, under the title of the National School of Decorative Art. The decree of the President indicates the desire of the Republic to foster native industries, but it is to be hoped that the independent spirit which is found in Aubusson may be never subdued under the weight of Government protection. The

tapestries of Gobelins and Beauvais were for many years inspired by the taste of the Court, while in Aubusson there was always more freedom without any loss of art. The town has, besides, shown remarkable enterprise in producing tapestry of a kind that corresponded with the public demands, and at the present time a large number of weavers find constant employment there.

THE Italian Government have approved of several schemes for new works in Genoa, which will greatly alter the appearance of the superb city. The fortifications on the east side of the town known as the "Fronti basse" are to be pulled down, and the ground gained will in part be converted into a military parade ground, and the rest will be appropriated as building sites. The "Marble Walk," which extends round the bottom of the harbour, is also to be pulled down, and the space gained given up to trade. The custom-house is to be removed to a new and more suitable building, and the present one, which is the famous old Bank of St. George, will be turned into an art museum. Many other changes are to be made, with a view of fitting Genoa for its increased and increasing trade; and some of these changes will unfortunately do away with much that is picturesque and recalls the great days of the old Republic. But modern trade is inexorable. Space was required and could be obtained in no other way, unless the Genoese had consented to shift their commercial centre to Sempierdarena, where there is still a considerable area of flat ground unoccupied, and which, sooner or later, must be utilised.

A CIRCULAR has been issued, which bears the names of the principal artists and authors in Paris, asking for aid to erect a memorial of EUGENE DELACROIX, who is rightly described as the "grand peintre dont se glorifient l'art et la France." It is also signed by Sir FREDERICK LEIGHTON, P.R.A., who has been an officer of the Legion of Honour since 1878, and Sir RICHARD WALLACE, whose name is powerful in France. That DELACROIX deserves a memorial is beyond a doubt. His works may never be popular, for he cared more for colour than for form, or the representation of incidents. His pictures are experiments, and, generally, no man was more dissatisfied with them than was the author. But the characteristics which have diminished the popularity of DELACROIX have endeared him to artists, and he has a claim to be called the painters' painter. There is one great obstacle to the project. DELACROIX in his will prescribed the style of his monument, but he sternly enjoined that there was to be no statue or portrait in relief. It is, therefore, requisite, if the artist's wishes are to be held sacred, that the memorial should be emblematic. Another question is the site. DELACROIX occupied a modest studio in a house in the Rue Furstenberg, an out-of-the-way court, leading from the Rue Jacob. There is an open space which would serve for the site of the memorial, but in that position the work would be seen by few. The Committee will have to seek a site, and for many reasons they will have to restrict themselves to the St.-Germain district.

THE Metropolitan Board of Works have during the past year received 330 applications for the erection of buildings beyond the general line of frontage, of which 177 were granted and 153 refused. For the construction of porticoes, balconies, and verandahs, 118 applications were received, of which 81 were granted and 37 were refused. There were 134 applications for approval of plans for the formation of new streets, of which 69 were granted and 65 refused. The total length of the new streets sanctioned during the year is about 19 miles. On the other hand, permission was given for the closing, either wholly or partially, of about 120 streets.

THE return of the fees received by the district surveyors of the metropolis in 1882 has appeared. In that year there were 9,853 new buildings, on which the fees amounted to 22,482*l.* 19*s.* 3*d.* The fees on additions and alterations were 14,265*l.* 3*s.* 5*d.* The amount paid for arrears was 13,533*l.* In the sixty-nine districts the total received was 50,281*l.* 5*s.* 6*d.* The value of the surveyor's office varies considerably. The gross fees received in twenty-nine districts during 1882 ranged from 73*l.* to 589*l.* In two of those districts the receipts did not amount to 100*l.* each; in three districts the receipts were less than 200*l.* each; in nine less than 400*l.* each; in five less than 500*l.* each; and in ten less than 600*l.* each. In thirty-eight districts the receipts ranged from 616*l.* to 2,170*l.*

## ILLUSTRATIONS.

ST. PAUL'S VICARAGE, FOREST HILL, KENT.

THIS vicarage, for the Rev. FRANK JONES, has been recently completed from the designs of Mr. E. W. MOUNTFORD, A.R.I.B.A., of 22 Buckingham Street, Strand, W.C., and Mr. H. D. APPLETON, A.R.I.B.A., of the Wool Exchange, Coleman Street, E.C., who were the joint-architects. The builder was Mr. WILLIAM ROBINSON, of Lower Tooting, S.W. The walls are of yellow stock bricks, with red brick arches, quoins, &c., the gables being hung with Kentish tiles and the roofs covered with Broseley tiles. The internal joinery is of pitch pine. The illustrations are from drawings by Mr. J. STONIER.

NORMAND MEMORIAL HALL.

THIS building is arranged as a public hall for a northern village, and has been designed by Dr. R. ROWAND ANDERSON, architect, of Edinburgh.

BISPHAM PARISH CHURCH.

THE new building occupies the position of the previous church, the old foundations being utilised. The plan comprises nave with south porch, chancel, organ chamber, and vestry. The tower is at the west end, forming the principal entrance. By an oversight it is described in the illustration as forming part of the south-east instead of the south-west view.

The internal masonry is from the Stourton quarries, the external from Longridge, with parpoint walling. The roofs are of pitch-pine framed open timbered. The windows of chancel and some of the nave are filled with stained glass. The chancel is laid with encaustic tiles, and the church warmed by means of hot-water apparatus.

The church has accommodation for 311 persons. The building was commenced in 1880, and completed the end of last year. The total cost has been about 3,500*l.* The works were carried out from the designs and under the superintendence of Mr. JOHN LOWE, F.R.I.B.A., Manchester.

OATLANDS WESLEYAN CHAPEL, HARROGATE.

THIS chapel, which has been recently erected, occupies an irregular site which called for a special treatment. The buildings, as seen from the Leeds Road, are somewhat quaint in outline. The west end, with its high-pitched gable and two three-light tracery windows, forms a good foreground for the receding side elevation, pleasingly broken by the entrance-porch, beyond which are placed the two vestries. The materials used are brick and stone dressings, the windows being filled with leaded lights. The interior is 56 feet long by 32 feet wide, and gives accommodation for 300 persons. The rostrum and communion table are of pitch pine and English oak, with Lincrusta Walton introduced in the panels. The east wall is broken by an arched recess, within which is placed the seat of rostrum; the roof, of hammer-beam construction, is ceiled at collar. Ventilation is obtained by fresh-air inlet flues and outlets in roof. The work was carried out by local contractors under the superintendence of Mr. JAMES WILSON, architect, 12 East Parade, Leeds.

RHONDDA JOINT CEMETERY BUILDINGS, GLAMORGANSHIRE.

THE above have recently been erected for the Burial Board, in compliance with the requirements of a rapidly increased population, and are situate on rising ground in the midst of the colliery districts. The mortuary chapel (which is used by all denominations) is entered from the south porch under tower, which also serves as a coffin rest for extreme cases; immediately opposite is the exit to burial grounds. The plan consists of a nave with central aisle, with a chancel and vestry at eastern end. All the seats, pews, &c., have been executed in pitch pine. The roof is diagonally match-boarded in panels, with moulded ribs, &c. The reading-desk is of English oak, and carved. All the exterior dressings and tracery have been executed in finely-tooled forest stone. The walling is of blue pennant, with main angles drafted, the voussoirs being relieved alternately with Bridgend stone. The spire is covered with cleft English oak shingles, 10 inches by

5 inches by  $\frac{3}{8}$  inch. Seating accommodation is provided for 200 persons. The total cost of chapel, including caretaker's lodge and entrance gates, has been 2,700*l.*

The work has been carried out by Mr. H. KRILL, of Tonypany, from the designs and under the superintendence of the late Mr. WILLIAM H. JENKINS and Mr. THOMAS R. PHILLIPS, joint architects to the Board.

DESIGN FOR A REREDOS.

## THE ART FOR SCHOOLS ASSOCIATION.

A REPORT has been given of the work done by this excellent society during the first year of its existence. The means placed at the disposal of the association have not so far been large, amounting altogether to 191*l.* 10*s.* 6*d.*; but inasmuch as the principle of the committee has been to assist chiefly those schools that were ready to make an effort to help themselves, it has been possible to carry out satisfactorily a part at least of the original programme.

The readiness with which a number of the leading print-sellers and publishers associated themselves with the objects of the committee permitted the latter to select a large number of works of art, prints, etchings, photographs, &c., and to offer them to the friends and managers of elementary schools at prices not prohibitory. Of these works of art, numbering upwards of 150, an exhibition, chiefly intended for the information of school managers and teachers, was held in the winter at the rooms of the Fine Art Society, and a catalogue was issued giving short descriptions of the pictures and their artists, and stating the reduced prices at which elementary schools might purchase various groups of works through the agency of the association. At the close of the exhibition the pictures were removed to 29 Queen Square, Bloomsbury, where they now form a standard specimen collection from which choice may be made by schools desiring to purchase.

The result has been a steadily increasing demand for the works recommended by the association. The London School Board has warmly assisted the movement. The Birmingham School Board has also given support. At Bradford a branch committee has been formed, and an exhibition, following in some respects the lines of the London exhibition, but in others greatly improving on them, was held six weeks ago in that town. Other large towns have shown great interest in the project. Since the beginning of the year the Art for Schools Association has issued more than 800 pictures, of which over 600 have been supplied to elementary schools in London and another 100 have gone to schools of the same class in various parts of England and Scotland. But though the committee aims first at serving elementary schools, it does not propose to confine its usefulness to that class, and, accordingly, under certain restrictions, some middle-class and a few charity schools have been allowed to share in the benefits procured by the association. Finally, a few private schools, though of necessity excluded from the special pecuniary advantages open to elementary schools, have been glad to avail themselves of the help of the association in selecting and purchasing suitable pictures.

So far the conduct of this business agency has been the principal work of the committee. It is not, however, all the work that the association aims at doing; and the committee are now beginning to form special loan groups for circulation among schools which cannot afford to purchase them even at reduced prices. In order that the public may have a fair opportunity of judging of the initial work of the association, five of these groups are being shown in the educational section of the International Health Exhibition. They may be found on the walls of the newly-erected technical schools, to be opened in the course of a few days as an annexe to the other buildings.

In all its work, and especially in this very important department of forming loan collections, the association is much hampered by want of funds. The whole sum so far placed at the disposal of the society by voluntary contributions amounts to less than 200*l.* Seeing that no profits are made on the sale of pictures, all office expenses, as well as those of the Winter Exhibition, of advertising, of correspondence, and of the purchase of loan collections have had to be met by these receipts. It need hardly be said that under these circumstances the incomings have barely covered the outgoings; it has been impossible up to the present moment to employ any paid service.

It is obviously impossible for the association to develop its full powers of usefulness while thus hampered, and it becomes necessary to appeal to the public for more liberal pecuniary support. It is estimated that an assured annual income of 200*l.* would enable the association to carry on its present work with comparative ease; with less it can hardly continue to exist. Subscriptions and donations should be sent to the hon. treasurer, Mr. Wynnard Hooper, 2 Pembroke Gardens, W., or to either of the hon. secretaries, Miss Mary Christie, Kingston House, Kew, and Mr. Lionel G. Robinson, 19 Kensington Square, W.

## WATER SUPPLY IN ENGLAND.

A LETTER from Mr. Baldwin Latham, C.E., has been published, in which the writer says that from observations which he has been conducting for some years in various parts of England, he is able to point out that if a line is drawn north and south through Leicester, in all places near that line the quantity of underground water stored in the new red sandstone, oolite, and the chalk is about equal to its normal quantity at this period of the year; in places to the west of this line there is an increase of water beyond the normal quantity, while in places to the east, there is a marked deficiency in the quantity of water stored in the ground. The springs in the chalk in the North Downs, which furnish the perennial supply of water to the streams of Surrey and Kent, are now at a lower point than they have been at any corresponding period for many years past, and we shall probably have this year a smaller flow in the River Thames than has occurred for a considerable period. At the present time the upper tributaries of the Thames, taking their supply from the chalk of Wiltshire, contain an abundance of water—more than at the corresponding period last year—but as we pass eastward towards London, the supplies are of a limited character, and, in all probability, within the area of the River Lea, we shall have this year a lower state of the water than has been recorded for many years past, as within the drainage area of this river and north of it, passing into the oolite districts of Northamptonshire, there is a marked deficiency in the quantity of water stored. From records of underground water, it appears that there is a marked deficiency of water in the ground every ten years: for instance, there was a deficiency in 1854, 1864, 1874, and, in all probability, this low water will occur again this year. Although it is most marked at the present time in the south-east districts of England, yet from the rapidity with which the springs are now falling in other parts of the country, the evidence all points to a general low state of the water in the autumn of this year.

Whenever the water in the ground has reached a considerable degree of lowness, when replenishment commences, in all places in which the water is liable to pollution we have the conditions which bring about epidemics of typhoid fever, and it therefore behoves all persons who are suspicious of the quality of their water supply to take the precaution to have all water used for dietetic purposes boiled before it is used during such periods as we are now entering upon. By adopting this precaution, much illness and suffering may be prevented.

## WENLOCK ABBEY.\*

WILLIAM OF MALMESBURY'S account of the history of this abbey, together with the assumption that it was originally founded by St. Milburga, A.D. 680, is commonly accepted. But this assumption appears to have been started not earlier than the fourteenth century. At all events, St. Milburga became its abbess, and was such at the time of her death in 722 (according to some writers), and she was buried here. Her parents were Merewald (brother of Wulphere, king of Mercia, who commenced his reign about A.D. 657), and Ermenburga (daughter of Ermenwood and niece of Earconbert, king of Kent, who began his reign A.D. 640). Her mother founded a monastery in the Isle of Thanet, and others of her relations seem to have done many pious acts for the Church. It is not recorded when St. Milburga presided over the nunnery, but it is considered not to be before A.D. 694. From the death of St. Milburga to the year 1071, when it was surrendered to King William I., the history of the abbey is veiled in darkness; but it is said that it was refounded in A.D. 1017, in the reign of Edward the Confessor.

At the time of the compilation of Domesday Book, the whole of the lands of this church were in the hands of Roger de Montgomery, the first Earl of Arundel and Shrewsbury, to whom they had been granted by the king. From him they passed again in the reign of King William II. to the new Order of Benedictine Monks of Clugny as a dependency to that Order. This affiliation continued for three centuries—not, however, directly to Clugny, for the actual ownership was in the Priory of La Charité-sur-Loire, which was again subject to Clugny. From the entry in Domesday Book it is certain that the Saxon church was actually in existence at its date. William of Malmesbury, writing about 1125, says "a convent of Clugniac monks was established there while a new church was erecting." By the discovery of the body of St. Milburga during the erection of the new church, the reputation and profits of the monastery were greatly enhanced. Her body was re-interred in front of the high altar on May 26, 1101. The priory was naturalised in the 18th of Richard II. Its revenues and patronage were assumed by the English kings. It grew in wealth and importance, and its precincts extended over thirty acres. Other priories were affiliated to it. Its benefactors were numerous, and Isabel de Say, Lady of Clun, was (after Earl Roger) the greatest.

\* From a paper read by Mr. Charles Lynam, architect, to the members of the North Staffordshire Field Club.

She, at the end of the twelfth century, endowed the abbey with large and valuable patronage. King Henry III. repeatedly took up his abode at Wenlock. In 1333 its wealth was so increased that in a contribution on the marriage of Edward III.'s sister it stood tenth in importance in the kingdom. In 1337 the first blow was struck at its liberty, and attacks were repeated till they reached their climax two centuries afterwards.

The priory was never exalted into an abbey. Its surrender occurred January 26, 1542, when the value was returned gross at 481*l.* 16*s.* 3*d.*, and the prior, John Baylie, received a pension of 30*l.*; the sub-prior 6*l.* 13*s.* 4*d.*, seven priests 6*l.* each, and four others 5*l.* 6*s.* 8*d.* each. Thus, in lieu of their large revenues, these thirteen men received 100*l.* amongst them. The Clugniac Order was a reformed branch of the Benedictine, whose black robes they retained; their rules were more rigid, and their food and clothing more scant. Stringent rules with regard to silence were a distinguishing mark of the Order.

Turning now to the buildings, it need hardly be said that nothing remains of the Saxon church at the present time; the oldest buildings now to be seen are the chapter-house and the block running east and west adjoining it, variously called the "Infirmary" and the "Guest House." These probably date from the time of Roger of Montgomery. The church appears to have been begun at the east end and to have proceeded westward. The lady chapel was a subsequent addition of the fifteenth century. The church consisted of a choir of seven bays with north and south aisles. Transepts with three eastern chapels to each, and with a covered arcade of three bays to the west, that on the north side having a crypt beneath it and that on the south being open to the cloister. Nave of eight bays, with aisles. A north porch and a chamber of three bays over the west end of the north aisle. There were stair turrets at the south-west angle of the nave, at the north-east angle of the nave, and at the north-west angle of the north transept. At later dates were added the lady chapel at the east end of the choir and a building of seven sides to the south of the south aisle of choir. Near this building is the base of the wall of an isolated structure, the use of which is not apparent. In section, the church throughout consisted of a main arcade—a triforium and a clerestory, and there were two passages round the buildings within the thickness of the walls, one at the level of the triforium and the other at that of the clerestory. The several staircases led to these passages.

The whole area of the church—nave and aisles, choir and aisles, central tower, and transepts and chapels—seem to have been groined throughout. The total length of the church was 332 feet, and the width, including aisles, upwards of 61 feet. The width of the church across the transepts was 144 feet. The height to the vaulting of the nave is said to have been 60 feet. The main entrance into the church was at the west end of the nave; the jambs on the south side still remain, showing it to have had six orders of mouldings; also an entrance from the west walk of cloister, which still remains intact, and probably another from the east walk of cloister. Through the care of the present owner, every part of the original church may now be traced, as the foundations have everywhere been disclosed, and it is somewhat extraordinary that in no case have the lower part of the walls been entirely removed. They appear to have been buried for many years, but have been gradually uncovered with care and caution. Here it may be permitted that a tribute of gratitude be paid to the owner, who, it is evident, religiously preserves everything that comes to light belonging to the abbey, and insists upon such rules being observed as contribute to that end.

The principal remains at the present time consist of the southern half of the west front, with three bays of the south aisle, including the chamber over them, the three walls of the south transept, and the west wall of the north transept. It is curious that features which are peculiar to this abbey should have become its most lasting remains, but so it is. The unique room at the west end of the south aisle, the equally unique arcadings on the west of the transepts, have, by their extraordinary strength of construction, kept together the only parts of this majestic structure which enable us to form an idea of its magnificent proportions, its marvellous constructive skill, and its artistic beauty. The exact uses of these peculiarities have not, after all the learning and acumen bestowed upon them, been revealed to this day. The chamber at the west end has been put down as "a vestry," "a chapel," "a court;" but no conviction has yet been conveyed by these guesses. The arcading west of the transepts has in like manner been construed as "accidental" and as the site of "altars," which in the case of the southern ones would have been open to the cloister walk. They have also been called places of retirement for scribes or more studious monks. After all the exercise of critical intellect on this point, it will be put down as very presumptuous if I venture on a suggestion; but an idea has occurred to me, and I make bold to express it. As to this work being "accidental." The builders of old did mighty little that was "accidental." They had purposes to fulfil: they knew what they were, and they met them with reason and with consummate skill.

Now what I venture to suggest is that the reason for this arcading was not one of plan or of accommodation, but of "structural necessity." Look at this building as it originally existed,

and you will find that the highest and longest length of walling without lateral support would have been the western flanks to these transepts. Think of the weight and thrust of the vaulting which would have been thrown upon these walls, and you will agree with me that some extraordinary support was necessary at these points. But it may be asked, What about the other side of these walls? and the answer is that to them the chapels rendered the needful counterfort. Again, perhaps others may ask, Why not have put buttresses? Well the works of the monks in these buildings answer this emphatically. A buttress was not their idea of counterfort: there is scarcely a buttress about the whole church which projects more than the length of one's hand, but means of extra strength are supplied in another, and, as I think, more artistic manner. The gable of the north transept is built against the chapter-house. In order to secure sufficient strength here, this wall was thickened by a series of arches—so in the west wall of the north transept. On these grounds I suggest that the arcadings west of the transepts were erected for the purpose of structural stability, and I point to their existence at the present day in support of this. That the extra stability given by the construction of the chamber at the west end of the aisle accounts for its existence now there can be no doubt.

The windows in the south gable of the transept still remain, and are of single lights; those to the room over the south aisle are of two lights, with early tracery in their heads, whilst the west window of south aisle is a small single light, with semicircular head. The south jamb of the great west window still remains, and shows the mortices for the cross-bars to which the glazing was attached. The west wall is 7 feet 3 inches thick, and has ashlar facing outside with wide-spreading base weatherings. The wall of north aisle is 4 feet 9 inches thick, with ashlar facings outside and rubble inside. The north porch walls are 3 feet 9 inches thick. The character of the masonry to lady chapel differs from the other parts of the buildings. Its buttresses have much greater projections; the walling is built of stones much larger in size, and its base moulding is of fifteenth-century work. In length it appears to have been of two bays only. There are many fragments of fifteenth-century mouldings placed about its walls, on some of which the marks of the masons are still to be seen. There is evidence of the rubble facings inside having been plastered, as fragments of it are still visible in various parts.

The interior effect of this church must have been extremely magnificent. The long vista of its arcades of nave and choir, with its height of triforium, clerestory, and vault, crossed in the centre by the great central tower and transepts on either side, its grandeur of proportion and delicacy of detail must, indeed, have embodied a building the like of which is but rarely to be seen. Little did the men who raised its walls and poised its vaults think that their work would for centuries remain but a mere useless ruin—useless in respect of the purpose for which they toiled, but not as demonstrating their own matchless skill. Next to the church, the chapter-house, of still earlier date, calls for observation. It was a quadrangular room, with three open arches to the west and windows to the east. It was divided in its length into three bays. The lower part of its walls are perfectly plain and built in coursed rubble; the upper part is arcaded, starting from an enriched string. Above the arcade are two tiers of intersecting semicircular arches, delicately moulded, which give great richness to the wall facings. The lower part of the groin ribs are still to be seen. Though there is much symmetry of treatment in this apartment, there is also a great variety, and that where it would be least expected. The eastern bay, though in effect uniform with the others, is even in the main arcade quite different from them: instead of triple shafts, it has single shafts with carved enrichments. In the arch mouldings of the south wall there are carvings not seen in the north side. In this wall there is a stone lintel to a former opening, which shows that, though the builders delighted in the use of the arch, they did not refuse the square lintel when it was necessary to construction; and their sculptured treatment at this stone again exhibits their skill. From the south wall of the transept there were doorways into the roof above the vaulting.

The interior of this chapter-house is another display of the fondness of the twelfth-century designers for decorative effects, and again shows that, though they employed massive and ponderous construction in the main features of their buildings, they knew full well how to deal with lightness and delicacy where enrichment was desired. The apartment over the west end of the south aisle next claims attention. It appears to have been used as a place of assembly of some sort, as its walls have stone benches along them. It is divided into three bays, and its groining still remains. On its south side it has an entrance and two windows of two lights each, and at the west end it has also a two-light window, and near it a doorway leading to the staircase which communicated with the triforium and clerestory galleries. The workmanship, proportions, and detail of this room are equal to anything that elsewhere remains. There are evidences of the existence of a lean-to roof to the cloisters, and the foundations to the buildings west of the cloister garth are now disclosed. Within the cloister garth, and near the west walk, the lavatory of the monks is still to be seen in its lower part, and very beautiful and elaborate are its

several features. On the south side of the cloister was the refectory, a noble apartment of lofty proportion, with a groined roof. To the west of this was the kitchen, but very little remains of it. West of the buildings which formed the west flank of the cloister are the foundations of an isolated work which appears to have been a Calvary cross, and would be in view immediately the entrance to the abbey was approached. This entrance lies still further to the west, and is marked by a single tower with doorways on two or more sides. At the angle next the present schools there is the spring of an archway which may have formed that of the great gateway. To the south of the chapter-house and some distance from it there is a building which has been called the "Infirmary," and it has features of great interest about it. On its western flank are sundry corbels which appear to have carried roof timbers. The house now occupied by Mr. Gaskill is constructed out of a building of the same date as the chapter-house, which appears to have been two storeys in height from the first, and has massive walls pierced by windows on both sides with a doorway on the south side all of Norman character, and of the abbot's dwelling, a building of late fifteenth-century date. Its rooms look east, and are approached on the two floors from a long corridor on the west side. This wing of the buildings is picturesque, and now forms the greater part of the remains. In it is the abbot's chapel with its original altar. It is a good example of what may be called a domestic chapel—placed within the house—easy of access, unobtrusive, yet emphasising its special purpose. Of the outworks of the abbey precincts there are many indications, but they are not to be detailed here. In the boundary wall to the east there is a projection which appears to have been rendered necessary by the erection of the lady chapel, which was an extension eastward from the original east end of the church. Fragments of all kinds are carefully stored in the arcading west of the south transept, and serve to assist the imagination in re-edifying this once artistic and effective religious house.

#### THE LATE ARTHUR PERIGAL, R.S.A.

THE Royal Scottish Academy has, says the *Scotsman*, lost another of its older members by the death of Mr. Arthur Perigal, which took place quite unexpectedly at an early hour on the 5th inst. The son of an artist bearing the same name, who had come of an old Norman family driven into England by the revocation of the Edict of Nantes, Arthur Perigal was born in London in August 1816. He was yet a lad when his father removed to Edinburgh, and established himself in what ultimately became a very good connection as a teacher of drawing. While largely occupied in teaching, the elder Perigal, who had studied under Fuseli at the Royal Academy, and had for some time practised portrait painting in London, would seem to have continued assiduous in the use of his pencil, and from 1833 onward exhibited at the Royal Scottish Academy portraits and landscape subjects, which earned him some reputation. Under his father's instruction, young Arthur early commenced the practice of painting, and appears from the first to have devoted himself almost exclusively to landscape. He also followed the paternal example in becoming a drawing master, in which capacity he had, we believe, for many years a highly successful career. Meanwhile he had the good fortune to obtain early recognition for his own artistic efforts. His name first appears in the Academy catalogue for 1838, in connection with a study of John Knox's pulpit and several renderings of Trossachs scenery; and from that time forth he continued a regular and liberal exhibitor. The year 1841 saw him elected an Associate of the Academy, in 1868 he attained the full status of an Academician, and, four years ago, on the death of Mr. Charles Lees, he was elected treasurer to the corporation. During the half-century or so over which his artistic activity extended, his industry seems to have been indefatigable. He has been heard to say that, from the time when he could claim a place upon the Academy's walls, he always contributed his full quota of work; and if that be so, the number of landscapes exhibited by him from first to last must have exceeded three hundred. Fond of travelling, he roamed in search of subjects over all parts of Scotland; while making occasional raids into the mountainous districts of England and Wales. Switzerland and Italy were repeatedly visited and laid under contribution for sketching purposes; and he also made an extensive tour in Norway, which afforded him abundance of congenial material. The fruits of all these journeys were to be seen from year to year in his exhibited pictures. While naturally ranging, in the course of such varied practice, over a considerable diversity of subjects, he always showed a special predilection for the loch and mountain scenery of the Scottish Highlands; his favourite effects being those in which cloudy skies afford a lively interchange of shade and sunshine. He was also very partial to the banks of Tweed and Teviot; a constantly recurring subject being a fine reach of fishing water, with an angler plying his craft, to suggest what in the artist's eyes was by no means the least attraction of the scene. Roman and Venetian views were of less frequent occurrence, and generally on a comparatively small scale; but Norway furnished

the themes of several large canvases, including an effective picture of Romsdale produced some years ago, and a striking glimpse of torrent and mountain submitted in the recent exhibition. Commencing when he did, Mr. Perigal naturally fell under the not altogether beneficial influence of Macculloch. He early formed a decidedly individual manner, which seemed to aim at brilliancy and sparkle, and attained results that were more popular in the artist's young days than they have been since our painters began to cultivate, and the public to desiderate, a closer reference to natural colour and effect. Among the best of his oil paintings were, perhaps, to be ranked his representations of Border scenery; of one of which, exhibited within the last two or three years, affording from under trees a far-stretching view of rolling champagne and blue hills, we retain an agreeable impression. His water-colours, generally speaking, showed a breadth and transparency of effect not always realised in the other medium; and his studies from nature are said to be vigorous and telling, some of the sketches made in Venice being specially noteworthy for the effectiveness of their perspective. Personally, Mr. Perigal was a man of kindly and genial disposition, whose companionship was prized by all who knew him.

### STRATFORD-ON-AVON PARISH CHURCH.

THE representatives of the Society for the Preservation of Ancient Buildings who were deputed to examine Stratford-on-Avon parish church, have presented a voluminous report on the subject to the Restoration Committee. As the report is of great interest, not only to the parishioners but to the general public, the committee decided to defer its consideration until their next meeting. The report describes at some length the restoration work carried out forty years ago according to the ideas of the times and in the best manner, but, as regards some things, with results which can only be deplored. Some of the most important stone details in different parts of the church were destroyed to make way for new copies. Fortunately this process was not applied everywhere, and much old work still remains. After making a few minor recommendations, the Commissioners report that the roofs appear to be in a good state, but there are certain appearances on the ceiling of the nave which raise the suspicion that there may be dry rot above it. This roof should be closely examined. They add:—"The roofs of the aisles were not renewed when the others were. They are a good deal strapped and patched, but seem to be substantially sound; and that on the south has a good deal of fifteenth-century work in it. It ought not to be taken away. That on the north is modern, and without any architectural character to mark its date. There would be no harm in replacing it by a better if it is wished to do so. The tower is cracked in various places, and some of the arches in it are crushed out of shape; but we cannot find that any movement is now going on. Plaster patches were put on the cracks in 1872, as appears by the date scratched on them. Many of these are not broken at all, and the rest have only slight cracks, which would be accounted for by the movement of the bells. There is the beginning of mischief in the tower, and it should therefore be carefully watched; but it does not appear to be now in a state which need cause anxiety. The spire is built on brick pendentives, which exert an outward thrust, and to counteract it iron ties and beams have been placed across the tower in both directions. This was probably done at the time when the spire was built, and it would be well to examine the ties, and, if necessary, to renew them." The Commissioners remark that the adaptation of the church to the requirements of the present day might, if properly managed, be made the means of bringing more into view its architectural merit and historical interest. In their recommendations the Commissioners state:—"The removal of the side galleries would be in many ways a gain, but it must be kept in mind that they cannot be taken away without reducing the nominal accommodation of the church. As it is now fitted up, the floor of the nave and aisle seats about 800 people, and although it might be rearranged on a better plan, the numbers would remain about the same. The galleries hold about 470. If the transepts were used for congregational purposes they would hold about 250, so that there would be a net loss of more than 200 on the removal of the galleries. If this loss cannot be afforded, the galleries, or part of them, should be kept, for any enlargement of the fabric for the sake of getting more seats is in this case quite out of the question. The only addition to the church which ought to be allowed is that of a vestry, which might be built on the north side of the chancel, where an ancient vestry once stood, the foundations of which remain in the ground, and its doorway in the wall of the church. A place ought also to be provided for the safe-keeping and exhibition of detached fragments of ancient work, of which there are some of considerable interest in the church, especially the fragment of a font—probably, as has been suggested, the font in which Shakespeare received baptism. This, it is stated, is too much broken to be put in use again, and could not be restored except by destruction. It should be placed in some part of the church where it can be seen, and where it will be safe, not in a dark corner where lumber is piled as now behind the organ. With

it should be placed the original heads of the sedilia from the south aisle, and such other relics of the same sort that lie about. As a final recommendation, the Commissioners say:—"The old glass now in the window of the Clopton Chapel should on no account be removed. It is scarcely necessary to add that all monuments and gravestones should be kept in their present positions. The fact that some of the latest monuments are the most out of harmony with the building suggests that it would be well to exercise a strict control over the admission of any such for the future. . . . It is a pity that so fine a building as this should be disfigured by the indiscriminate acceptance of well-meant but ill-judged gifts to it. When such things have been admitted their removal is often difficult, so that too great care cannot be used about them at the beginning."

### NOTES ON HERALDRY.\*

(Concluded from page 377.)

THE more you study good examples of blazon, the freer and more spirited will your treatment of charges become. Without this study the only safe way is to keep closely to the letter of your authorities. In every case, however, when you employ any armorial detail make sure that your authorities are trustworthy. During the last century the history of a city in the south of England was published, giving an incorrect engraving of the municipal arms. This has been unfortunately copied ever since, and the false coat appears frequently upon the Guildhall and other public buildings of the town. From what I have seen in various buildings, it seems necessary also to express a hope that purely imaginary coats of arms may not be considered admissible decorative features. I do not refer to those arms which may be assumed by a client without any right to the same (I do not think an architect could safely interfere in such a case), but I mean arms purely fanciful, designed out of mere wantonness. A short time since I noticed the spandrels of an entrance archway filled in with shields; one of these bore a bend, and the other, to balance the composition, a bend sinister! Another instance I can recall where the cornice of the tower of a modern house was "decorated" with escutcheons, each bearing a different ordinary, but in every case charged with three annulets or rings. Here, also, I would enter a protest against the common practice of making the shield receive monograms, dates, &c. Surely the invention of any designer should be sufficient to suggest some other form of panel than the shield to receive such details. Then, again, as a general rule, do not use a plain shield without charges as a decorative feature. This is, of course, constantly done, for a shield seems to be considered the right thing to fill up any panel or odd corner; but wherever possible let it do its proper work—that is, display a coat of arms. The crest was a cognisance or device borne upon the helmet, and it is now usually so represented surmounting the escutcheon. Although sometimes it issued from a coronet, cap of maintenance, &c., it usually stands upon what is called a wreath placed on the top of the helm. The wreath is composed of two twisted strands of silk, one tintured with a colour, the other with a metal, six folds being usually shown. It is now almost invariably drawn after one model; but a study of old carvings will suggest several legitimate variations, especially one form with more open twisting and with loose ends. Also compare the jewelled and enriched wreaths upon the effigies at Lowick Porlock and Bromsgrove churches, &c.

The crest is now very commonly drawn with the wreath only, the helmet being omitted. Although when it is only desired to exhibit the crest the helmet need not necessarily perhaps be always represented, still the two ought to go together wherever possible. When the crest surmounts the coat of arms, I think the helmet should always be drawn in its proper position, resting on the top of the shield, and bearing the wreath and crest. Never on any account represent a crest upon the surface of a shield as if it were a charge; this is altogether false heraldry. The form of the helmet has been made by the later heralds to denote the rank of the possessor. In Mediæval times this was not the case, and the artist was not bound by such rules. Even if, however, you do not break through the conventional usage altogether, still you can, within limits, vary the forms of your helmets. That of a gentleman or esquire is directed to be shown in profile with the vizor closed. Two types at once suggest themselves in representing this, derived from the early and later forms of Mediæval helmets. I had forgotten to mention in my remarks upon the proper representation of crests the absurd fashion of placing them within a strap or garter which is usually made to receive the motto. This custom has no doubt arisen from a foolish attempt to copy the arrangement in the arms of Knights of the Garter, where the shield is duly surrounded by the motto, "Honi soit qui mal y pense," upon its appropriate garter.

I now come to "mantling," which is used to form an ornamental background to a shield of arms. It appears, in the first instance,

\* A paper by Mr. Charles Richard Pink, read before the Architectural Association, May 30.

to have been derived from the "lambrequin," "cointise," or scarf attached to the helmet, and early examples show a very subordinate treatment of the feature in comparison with its subsequent development. Soon, however, the decorative capabilities of mantling were appreciated, and gradually were evolved those multitudinous folds, jagged and slit into acanthus-like outlines, which form so admirable a setting for the shield. The lowest points of the mantling are generally shown as terminated with tassels, often in late examples made to play an important part in the general design. In seventeenth-century work you will find examples (of which I have a few illustrations on the walls) where the original idea is quite lost, and the mantling is treated as a veritable mantel folded in different forms at the back of the shield. This treatment is not very admirable, and if used in carving the folds must be very delicate and the relief low. The effect is in many cases rather like that of a garment hung up to dry; and this idea is unfortunately only more pronounced, I think, when as in the Imperial arms of France, the mantel is "propped" with sceptres. Mantling, when artistically and vigorously treated, is undoubtedly a most valuable accessory to a coat-of-arms from a decorative point of view. The old designers lavished a wealth of fancy upon the variety of its curls and twists. Italian and late German examples are full of happy suggestion. One of the very best Old English examples may be seen over the entrance to Montacute House in Somerset, where the treatment is altogether remarkable in its freedom and richness. In the eighteenth century some palm branches enclosing the shield, and tied together at its base, formed a very common substitute for mantling. This expedient is not one worthy of imitation; but very charming examples may be found in older work, where the shield is surrounded by a chaplet of flowers. I have a sketch of a very artistic and satisfactory instance of this treatment taken from the tomb of Robert White at Christchurch, and you will notice in this case that the garland does not take the place of mantling, but is used in conjunction with it. Although rules have been laid down by many authorities for the tinctures of mantling, it would appear that they may really be left in most cases to the taste of the designer.

Supporters I can pass over with very few words. They are, as their name would imply, figures which support the shield on either side, and are, with few exceptions, only used in connection with the arms of peers. The chief difficulty in the way of their artistic representation is to find an appropriate standing ground for them. A panel or tablet (to receive the motto) is fairly satisfactory as a base, but the usual conventional riband is necessarily an unsatisfactory and weak one. The Mediæval artist often placed his shield in the position known as *couchée*, and allowed the supporters to stand upon the shield, and so support the helm and crest. This is, in many cases, by no means a bad way of meeting the difficulty. Do not confound heraldic supporters with the single figures often introduced in heraldic designs for purely artistic but not armorial effect. It was a very common practice in the Middle Ages to, in this manner, represent shields as held by angels and other figures. The old carvers and painters were also fond of hanging escutcheons by their "guiges" or straps upon trees, &c. All this kind of treatment is purely decorative, and should be made to appear so at a glance.

With regard to mottoes, a few remarks must suffice. The motto is usually inscribed upon a riband placed below the shield, but sometimes over the crest. Of course, however, it may be introduced quite independently of armorial bearings, and in any position that fancy may dictate. It is said that the "Loyal Marquis" of Winchester inscribed "Ayez Loyante" on each pane of glass in Basing House; and similarly, on almost every quarry in the hall windows at Mells, the Horners have placed their alliterative motto "Tyme tries trothe." It is difficult to give any very useful directions as to the drawing of ribands, but I may remark that they are by no means easy to design characteristically. I can only recommend a study of good examples, especially Italian and German. The works of Albert Dürer often afford suggestions for a more artistic and fanciful treatment of ribands than we usually have presented to us in modern work. Want of time prevents me from giving any account of that quaint offshoot of armoury which is exhibited in the form of Christian symbols heraldically treated. Our old churches abound in examples, but I am unable to do more than mention the subject to-night.

I hasten to the last division of my subject—viz., badges and rebuses. A badge is a family recognisance which may be treated with much greater freedom of design than the crest. Indeed it may, so long as its identity be preserved, be represented almost in any way that may suit the fancy of the designer. Badges were used for more everyday purposes than arms or crests, such as distinguishing the livery of servants or retainers, or indicating ownership of chattels, &c. It is undoubtedly a loss to modern heraldic decoration that the badge has almost fallen into disuse. It is always represented without a wreath or other accessories. Knots of different forms were commonly used as early badges, such as those of Harrington, Stafford, Heneage, &c. Royal badges in England have been numerous, and were depicted in the later Mediæval times with the greatest fancy and variety of design. The very names of some of them will call to mind their picturesque details, as, for instance, the white hart; the antelope, beacon, and

swan; the falcon and fetterlock; the rose en soleil; the angel and rose; the portcullis; Tudor rose, &c. Badges were sometimes impaled (like coats-of-arms) to show an alliance by marriage. I have a small sketch on the wall which presents Henry VIII.'s rose impaling the pomegranate of Arragon. Rebuses are familiar to all of you. They consist of a fanciful combination of objects forming pictorially a punning allusion to the name of the user, and were very commonly adopted by church builders. Examples will occur to everyone, such as Beckington, Langton, Silksteds, Hunton, Sugar, &c. The colouring of rebuses may be, of course, left to fancy, and, even with badges, in many cases the tinctures are not in any way prescribed. I may just mention here that occasionally for decorative purposes some of the principal charges of a coat-of-arms were used freely as badges upon the owners' buildings. I remember a remarkable instance of this on the Worcester excursion at Westwood Park. Here the garbs (sheaves) and mullets (stars) of the Packington arms have been used, apart from the shield, for all kind of decorative purposes.

I have now passed rapidly over almost the whole field of armorial display, and I must bring my remarks to a speedy close. Before doing so, however, on behalf of heraldry and its kindred study, genealogy, I feel constrained to say a word anent the preservation of the memorials of the dead (often rich in armorial details) existing in our churches and churchyards. That there has been great destruction of such monuments of late years there can be no doubt; I can recall myself many instances. In one church in Norfolk the old floor, rich in ledger stones and brasses, has been buried (so I am informed by a well-known archæologist) under a layer of concrete and paving tiles. As a rule in church restorations ledger stones have been removed and often destroyed, tablets stripped from the walls, and, as to headstones in the churchyard, I was once asked to use some as bonding stones in new walling. Not long since I was looking over a fine church in Oxfordshire with the rector. The building had been thoroughly well "restored," and the floor had been repaved with tiles throughout, all memorials of the forefathers of the hamlet being removed. The parson, in reply to my questions, informed me that formerly there had been many ledgers, some of them very interesting as touching upon local history and legend. He added that he now saw his mistake in obtaining a new uniform pavement. Uniformity and bright colouring had indeed been secured, but he found them, on longer acquaintance, eminently uninteresting, and vainly regretted having destroyed those old stones, which had each a story to tell of the silent past. I think it was our member, Mr. Sedding, who on one occasion, in the face of much opposition, brought the reredos and altar in a church under restoration to a forward position in the chancel rather than interfere with the monument raised against the east wall over the tomb of an ancient worthy of the parish. I, for one, am thankful for such an example as this. All monuments should, if possible, be allowed to remain *in situ*, especially if those whom they commemorate lie beneath them. In no case must there be destruction. Tablets should not be taken down and be deposited in the belfry or heating chamber, but retained on the walls. Floor-slabs should not (if they are fortunate enough to escape immediate destruction) be placed under organs and church fittings, or be slowly worn away as pavings for entrances and gangways. Our church and churchyard monuments deserve our care quite irrespective of their architectural character, which, I will admit, is often very inferior. Not to speak of the duty we owe to those who raised them, and of the respect due to all memorials of the dead, these monuments are of the greatest possible value to the local historian and genealogist, and often to the student of heraldry. A church denuded of them seems to have lost its old and pleasant associations with former generations of worshippers. I fear I have been guilty of digression, but this is a matter upon which I feel strongly, and architects may use a good deal of influence towards the preservation of these memorials. If, therefore, I have been fortunate enough to kindle among my hearers to-night any interest in this ancient art and science of heraldry, may it be shown, when occasion arises, in a strong effort to preserve those monuments which, in many cases, are not only records of old English family history, but also the best examples of that art which I have so imperfectly brought before you this evening.

## ELECTRIC LIGHTING OF MANSIONS.

THE electric light has been introduced at Linden Park, near Hawick, N.B., the residence of Mr. Walter Laing. Linden Park is about two miles from Hawick, and the house is a new one only just completed. A small stream—a feeder of the Teviot—runs through the grounds, and advantage has been taken of this to obtain power for producing electricity for lighting the mansion and stables. A turbine wheel has been erected capable of giving off about eight horse-power, and requiring about 270 cubic feet of water per minute when working at full power. As the stream will not in dry weather give nearly so much as this, a reservoir, in the shape of a small lake of about an acre in extent, has been constructed in the bed of the rivulet.

In the driest weather the stream may be depended upon to give at least 80 cubic feet per minute, and this being stored up in the reservoir during the day-time, more than sufficient force is obtained for working the turbine when the lights are required at night. The turbine is fixed in a small building, and is connected by a short belt with the dynamo, which is a Siemens' compound self-regulating machine, capable of supplying about seventy "Swan" incandescent lamps of 16 candle-power each. From the dynamo the necessary conducting wires are carried up to the house, partly on posts overhead and partly underground, branches being taken off to supply the stables and the avenue from the lodge. About 100 Swan incandescent lamps have been fitted up altogether, and of these 70 can be worked at once, and all or any can be turned on or off at pleasure. Most of the lights are of about 16-candle power, but a few are 32. About 80 lights are distributed through the house, lighting every portion, no other kind of light being provided for. Seven lights are taken up in lighting the stables, and twelve outside. These latter are all controlled by one switch near the hall door, and can either be lighted or extinguished instantly.

The effect of the instantaneous lighting up of the drive on a dark night is novel and pleasing. The distance of the turbine and dynamo from the house is about 350 yards, and from the house to the lodge about 400 yards, so that a circuit approaching a mile in extent has to be traversed by the electric current which goes to the farthest lamp. Very little attendance is required by the dynamo-machine or turbine, all that is necessary being to turn on the sluice valve admitting the water to the turbine when the lights are required, and it is only necessary for a man to inspect the machines about once in the evening.

For stopping the turbine at night when the lights are no longer required a simple electrical arrangement has been designed, by means of which the sluice valve can be closed from the house without going down to the turbine house. This is done by merely touching a handle, and so admits of the lights being burned late, and put out at any time without the necessity of keeping anyone in attendance to turn off the water when done with. The steadiness of the lights is absolutely perfect, and there are no products of combustion whatever given off to contaminate the air of the room and spoil the decorations. Mr. Laing is to be congratulated upon being the first in this district to show such a complete adaptation of the electric light for domestic purposes, and the abundance of water power at disposal in the neighbourhood will no doubt induce many others to follow his example.

The whole of the electrical portion of the work was entrusted to and successfully carried out by Messrs. J. Edmundson & Co., electric light engineers, of 19 Great George Street, Westminster, London.

### TECHNICAL EDUCATION IN AMERICA.

**A**N elaborate report on technical and industrial education in the United States and Canada has been prepared for the Royal Commission by Mr. William Mather. The author was occupied from May 23 to November 1 in its preparation, having travelled upwards of ten thousand miles, and made special inquiries in twenty-two cities. Mr. Mather says that there are 164,832 school buildings in the United States, which are valued at 42,282,308*l*. During the year 1880 the total amount expended in the schools was 19,371,525*l*. The primary schools are distinguished for the excellence of the buildings, sanitary arrangements, and class-rooms. The high schools have in most cases a science side as distinguished from the Latin or English side. Many of them are furnished with a chemical laboratory, a physical laboratory, and apparatus varying in quality and ranging in value from 500*l*. to 2,000*l*. Drawing is universally taught in these schools, but is only obligatory on the scholars who have adopted the science side. For those who have had previous training, advanced courses of drawing are conducted, but elementary instruction is also given when necessary. Of cities of populations from 50,000 upwards there are twenty-one in which drawing is compulsory, representing schools with an average daily attendance of 386,200 pupils. Of cities having a population between 10,000 and 50,000, there are fifty-eight having an average daily attendance in the schools, where drawing is compulsory, of 116,000 pupils. The introduction of this industrial drawing into the public schools is rapidly extending.

Descriptions are given by Mr. Mather of the system adopted in the principal technical schools. The teaching in Columbia College, New York, comprises mining, engineering, metallurgy, civil engineering, geology, analytical and applied chemistry and architecture, and in all the departments practice is combined with theory. The vacations are utilised as far as possible by actual employment in works. Everything appears to be done to keep the college abreast with modern requirements. The idea held by the President is that "the present studies must be continually improved upon and kept fully up to the spirit of the age as it advances; furthermore, new studies and branches of learning must be undertaken, and new professors appointed. We must not let the grass grow under our feet;" and his words augur a greater interest in technical education throughout the States.

In the Columbia College the students are required to be seventeen years old, and to pass a stiff examination before they are eligible for admission. The Cooper Institute in New York, on the other hand, is a technical night school for both sexes, and is free to all students. The building and appliances have cost 120,000*l*., and the total expenditure has been 320,000*l*. An endowment of 60,000*l*. by Mr. Cooper, in addition, clears the Institution of its ordinary expenditure. The children of Mr. Cooper have offered 20,000*l*. as a further contribution for the use of the trustees. The number of pupils in 1882 was 3,917. Of these, 1,169 entered the evening scientific classes; 1,797 the evening art classes: 496 pupils were admitted to the women's art day-schools (about the same number were declined for want of room). The plan of admission is "first come, first served," of any colour, clime, creed, or no creed. The object sought after in the art department is to make the studies practical and useful in the industrial arts.

From all sources, including painting and decorating china, and designing, the students of the Institute collectively earned 8,000*l*. last year for industrial work, executed in the classes, at the same time that they were receiving instruction in the principles of science and art. The trustees have the intention of extending more and more the department of design and construction, in order to strengthen the inventive faculty which Americans possess in a high degree, and which, guided by an intimate acquaintance with scientific principles, will become increasingly productive among the working classes.

No less remarkable is the new Working Man's School in New York, which is really a school for educating children to become intelligent and dexterous working men and women. The salient feature of the experiment is that it introduces what may be called the creative method into school education. The idea is to give lessons by the production of objects. "Industrial education," as conducted in this school, is to make the education of the hand instrumental in more rapidly, and yet with less mental strain, educating the brain. At eight years of age the children are led to become familiar with every geometrical form and figure by actually forming it in clay and paper. In advanced courses the same objects are formed in wood. Objects from nature are placed before the pupils, and, to emphasise the oral instruction, the pupils are required to reproduce the object by the work of the hands. Drawing first the object, the pupil is led to form it from the drawing. For instance, in forming a triangle or a cone the pupil makes a drawing from the figure. He then goes into the workshop with his drawing, and with clay, or paper, or wood, by the use of suitable tools, actually creates the object. Much of the apparatus used in the higher classes is made by the pupils. In all the courses, such as reading, writing, arithmetic, geography, &c., an objective method is adopted. There is scarcely a subject in the study of which the pupil has not to employ his hands. Drawing is the basis, and actual construction the vehicle, of all the knowledge imparted by the teachers.

The Stevens Institute of Technology, near New York, was founded with the object of giving a thorough technical and scientific training in mechanical engineering, and Mr. Mather says he has never seen its superior. Theory and practice are never separated during the four years' course, but there is no attempt to teach the trade of a mechanic, although manual exercises from pattern-making up to the completion of a piece of finished work in the various metals are daily carried out. The Rensselaer Polytechnic Institute, at Troy, is another engineering school which has won the highest reputation. Its graduates have taken part in the most important and original engineering works in America.

It would not be practicable for us to find space to notice the remaining technical schools which are described in Mr. Mather's report. But it is remarkable that, while so much is done in the United States to promote education in mechanical engineering and the allied branches, the schools of art, either for the industrial or fine arts, are not numerous in America, nor is there much to show of industrial value from those already established. It is probable that the further introduction of drawing into all the public schools, with special and properly-trained teachers, will cultivate a desire for higher instruction in art and design, in which case there is no reason to doubt that the necessary institutions will be supplied. The schools that more closely affect the local industries at the present time are the Maryland Institute of Baltimore and the Cooper Institute of New York. As schools devoted exclusively to art and design there is one in Philadelphia, the Philadelphia School of Design for Women; in Boston, the Normal Art School of Massachusetts, and a fine art school connected with the Gallery of Fine Arts and Museum; in New York there is also an art school of a similar character; and in most of the large towns there are small schools for drawing and designing. In San Francisco there is an important school doing very good work, but confined chiefly to the wealthier classes.

The conclusion drawn by Mr. Mather from his investigations is that the establishment of technological schools in the centres of mechanical industry in England is most necessary, and that we should follow the example of the United States without delay. Further, we may take a warning from America. Our national system of elementary education must not drift to the literary side alone to the degree that it has done of late in that country. The

storing of the memory with a multitude of extracts from books, which for a brief period after the school life may be retained and repeated as a proof of education, is altogether misleading for boys or girls who must face the stern realities of making their own living. The character of the teaching in America has recently been tending towards a distaste for manual work, but a movement is gaining strength to change the course of instruction in the public schools, in the direction of devoting a large portion of the school time to subjects of a practical nature, promoting tastes for industrial occupations based upon a knowledge of the natural sciences.

### WORKMEN'S HOUSES.

A PAPER on "Sanitary Houses for the Working Classes in Urban Districts" was read by Mr. H. Percy Boulnois, borough engineer for Portsmouth, at the Health Exhibition Conference on Tuesday. The author attributed the defects in existing houses to three causes, viz. :—(1) The avarice of the builder. So long as he can sell or let cheap houses, built with hidden defects, so long will they continue to be erected. (2) The ignorance both of builders and tenants. If the latter were educated in the simplest rudiments of structural sanitation at the Board schools, and in other manners, the former would soon learn that their ignorance or cupidity did not pay, and they would very speedily find out the remedy. (3) The want of sufficient supervision by the officers of the sanitary authority. This arises in no way from the fault of the officers themselves, but from the insufficiency of the staff employed. A change was certainly required in the present machinery and manner of the inspection of buildings in course of erection, and until a large staff of inspectors or sanitary police, or some such officials, were employed, very little real advancement would be made with the sanitation of buildings. To secure this adequate supervision a fee might be charged by the sanitary authority to the builder or owner, and although any provision which might increase the cost of construction of the house was undesirable, the extra cost of such inspection would be too small to be appreciable, while the advantages would be not only considerable to the community, as tending to improve the public health, but also to the owner of the house, as insuring good honest work for his money. In larger and more expensive buildings this supervision was generally exercised by the architect, but as a rule no architect was employed to supervise the erection of small houses, though in many cases one might have prepared the plans, and the builder was accordingly left almost entirely to his own devices, with frequently unfortunate results.

Professor Acland said that a great deal of knowledge on sanitary subjects had been diffused in this country, and the difficulty now was to get that done which we knew required to be done. With respect to domestic sanitation, no compulsory laws would ever bring about what was wanted. They must look to the spread of knowledge among the people. It had been treated as a joke that at the Health Exhibition educational apparatus was shown; but it was by education, and not by compulsion, that sanitary reformers would effect what they desired. There were also, of course, works which could only be carried out by the community, and for the satisfactory accomplishment of these they must look to the improving education of our legislators. Economy was essential in this matter of sanitary improvement. While they saw the loss caused by disease and the want of material comforts, they were bound, he thought, not to endeavour to force upon the people anything which was not absolutely necessary. In the exhibition might be learnt not only what was necessary, but how little it was very often that was sufficient to make a house a decent and safe habitation and to keep it as it should be kept, without imposing upon the owners or occupiers costly things which were difficult to obtain and complicated things which were difficult to maintain.

Sir Robert Rawlinson, agreeing most heartily with the last speaker that sanitary progress must be a matter not of State compulsion, but of education, commented upon the enormous and unnecessary expense frequently imposed upon the ratepayers in the execution of drainage and other works by local boards.

Captain Douglas Galton, the chairman, said that blocks of dwellings let in flats, if properly constructed, need not be unhealthy, and that provisions for warming—by steam, for instance, as was done in New York—and for efficient ventilation might be economically introduced in such buildings. With regard to separate houses in rural districts, cottages for the farm labourer were as much an appendage of the farm as the stables for horses, while in towns he thought it very desirable that our manufacturers should adopt some such arrangements as were in operation at Mulhouse and elsewhere on the Continent, where the workman was, so to speak, made an integral part of the works, had a good house built for him by his employer, and got a share of the year's profits. This would give us contented workmen, and diminish very greatly the difficulties of this sanitary problem. He believed that more powers might be advantageously given to the sanitary authorities, but he was certain that if sanitary authorities would exercise the powers they now possess to the fullest extent, and in an intelligent manner, we should have very few insanitary houses in England.

He thought there were many cases where, the demolition of houses unsuitable for habitation being required, the rates should be charged with the erection of dwellings, but in that matter they must proceed with great circumspection. We could not hope to remedy evils which had arisen in the course of centuries in a few years, but it was a most hopeful sign of improvement that the people were now greatly alive to this important question. It was by education alone that they could grapple with it.

### Darlington Free Library.

SIR,—In a paragraph notice in your issue of the 7th inst., of the laying of the corner-stone by Sir Joseph Pease, you state the building is estimated to cost about 5,000*l*. This is an error, as the present contracts, exclusive of furniture, lighting, palisading, &c., already amount to over 6,000*l*. As a matter of fact, the estimated cost is above 7,000*l*., and this, I may mention, is exclusive of the site, which has been given by the Messrs. Pease.

Yours faithfully,

June 9, 1884.

G. G. HOSKINS.

### Board School Competition at Darlington.

SIR,—I was exceedingly surprised to read such an *ex parte* statement, *re* the late competition for new Board schools at Darlington, as appeared in your issue of Saturday last. It is only fair to yourself and just to me that the imperfect, and consequently misleading, statements supplied to you by some writer should be supplemented by a few plain statements of facts. These I beg to give you and ask you to insert them in your next issue. The false and base insinuation of this writer respecting my father, and, inferentially, his censure upon the deliberate action of a body of gentlemen comprising eight-elevenths of the School Board of Darlington, I will leave to these gentlemen to deal with if they think necessary.

All the designs received the careful consideration of the Board, and, after fully considering the merits of each, two designs were chosen for the final decision of the Board.

At the monthly meeting, held on the 29th ult., these two designs came up to receive the judgment of the Board, all the members being present. Eight members voted for my design under the motto "Hope," whilst only three voted for the design sent in under motto "Three R's." The chairman and vice-chairman—who were perhaps more qualified to judge of the respective merits of the designs than any other members of the Board—both voted for my design, and any fair-minded person will be convinced that fair play was done and no favouritism shown when it is known that four Churchmen, two Roman Catholics, and two Wesleyans voted for my design.

My drawings were adopted by the Board on account of the excellent arrangement of my plan combined with a design, to say the least, not inferior to any other submitted in competition, and at a less cost.

I feel it is a great honour that my design has been adopted by the Board; but the honour to me is infinitely greater when I know that the members of the Darlington School Board who voted for my plans are above the suspicion of favouritism, that they have ability to judge as to the real merits of plans, and that they have conscientious convictions of duty, which they were only carrying out when they adopted my design.

Yours truly,

FRED. W. BROOKS.

### CHURCH BUILDING AND RESTORATION.

**Hoylelake.**—The foundation-stone of the new Congregational church was laid on the 6th inst. The site is at the corner of Station Road and West Kirby Road, and contains 2,500 square yards. It is contemplated, having regard to the increasing population of Hoylelake, that a much larger building may at some future date be erected on the part of the site where the temporary church at present stands, in which case the building about to be put up would be used as a lecture-hall and class-rooms. The present building, which will be constructed of brick and slate, will, according to the plans, be 65 feet long and 30 feet wide. The roof will be a high-pitched span, supported on arched principals of laminated timber. On one side of the church there will be an organ-chamber, 13 feet square, and on the other a vestry, &c., while to the rear there will be a room, 48 feet by 18 feet, to be subdivided and used for Sunday-school purposes. This room will at pleasure be connected with the church by means of an opening 18 feet wide, provided with shutters and curtains. The seats will be open benches, and the entire woodwork will be varnished without stain. The contractors for the whole of the work are Messrs. Smith, of

Hoyle; and Messrs. W. & J. Hay, of Liverpool, are the architects, under whose supervision the work will be carried out.

**West Monkton.**—The handsome parish church of West Monkton, dedicated to St. Augustine, which has recently undergone a thorough restoration, has been reopened. The building consists of nave, north and south aisles, with clerestory, porch and chancel, and is one of the best specimens of the churches of the Somerset type of architecture. The work has been carried out from the designs and under the direction of the architect, Mr. George C. Strawbridge, of Taunton, by Mr. J. Blackmore, builder, Hatch Beauchamp. The total cost of the restoration has been 1,000*l*.

### NEW BUILDINGS.

**Bloxwich.**—The new public buildings at Bloxwich, the outlying part of the borough of Walsall, have been opened. The buildings are in the Queen Anne style, and comprise a free library and reading-room, a police station, and accommodation for the sanitary work of that part of the borough. The block is so arranged that extensions may be carried out as may be necessary. The architect is Mr. F. E. F. Bailey, Walsall, and the builder Mr. D. Evans, Dunstall Hill Lane, Wolverhampton. The entire cost will be about 2,400*l*.

**West-End Co-operative Shoe Works, Leicester.**—The formal opening of the extension of these works took place on Saturday afternoon. It now forms one of the most extensive shoe factories in Leicester. The building occupies a triangular site with a frontage of about 190 feet to Dun's Lane, and about 200 feet to the river Soar. The main block consists of five large flats, each containing about 8,600 square feet, all well lighted from the frontages, and also from a central yard or area. A lower (three storey) building occupies the south-western portion of the site. The counting-house entrance occupies the centre of the Dun's Lane frontage, and on either hand is a larger entrance, one for the delivery, and the other for the despatch of goods, each of these entrances being provided with a powerful hoist communicating with the floors above. The ground floor contains the heavy machinery and the rivetters' shops, the engine-house and boiler. The first floor is occupied by the counting-house, the taking-in room, and the stock-packing and sample rooms. The second floor is appropriated to the nursery department or young children's shoe factory. The third floor contains the sewing machines and fitting room; and the fourth or top floor the clicking or cutting-out department. Airy and cheerful mess-rooms for men and women are provided. The architecture of the building is of Classic character. The materials for the principal fronts are red pressed brick, with ornamental dressings of Coalville and Reading brick, Coalville terra-cotta, and Derbyshire stone. The principal front is that towards Dun's Lane, the length being 190 feet, and the height of the main block 60 feet from the street level to the top of the parapet. The central block is crowned with a bold frieze and pediment, the tympanum being enriched with arabesque ornament in carved brick, and the attic storey above ornamented with urns on either flank, and with an ornamental feature in the centre bearing in a panel "the wheat-sheaf," the emblem of the society, carved in high relief. The building is heated throughout by steam on the high-pressure system. Thorough ventilation is provided, fresh air being admitted by means of numerous upright shafts, and the foul air being extracted by flues carried up above the roof, and fitted with patent extraction ventilators. The contractors for the works are as follows:—Builder's work, Mr. J. O. Jewsbury; carpenter and joiner's work, Mr. J. Cox; ironfounder's work, Messrs. Illston & Arnold; plumber, glazier, and painter's work, Messrs. Norman & Underwood; the mason's work has been executed by Mr. A. Westman, and the carving in brick and stone by Mr. S. Wilmot. The heating is by Mr. Thompson, of Rawdon, and the hoist work by Messrs. Waygood & Co., of London. The architect is Mr. J. Tait.

**Walsall.**—New schools at Palfrey, belonging to the School Board, have been opened. The block provides accommodation for 865 children—viz., 330 boys, 250 girls, and 285 infants. This makes the eighth set of schools in the borough belonging to the Board, raising the total accommodation in the Board schools to 5,647. The total cost is estimated at 4,850*l*.—viz., the erection of the building, 3,599*l*; furnishing, 350*l*; architects' commission, 200*l*; extras, 150*l*; and land, 551*l*. The architect was Mr. Loxton, and the builder Mr. Whistance.

### GENERAL.

**The Dean of Windsor** has been appointed a trustee of the British Museum, in place of the late Duke of Albany.

**The Duke of Norfolk** has subscribed 3,000*l*. towards the support of the technical department of the Firth College, Sheffield.

**A Committee** has been formed for the restoration of Worms Cathedral, a building which has already been debased by the experiments of restorers.

**Mr. Richard Sangster**, architect, of Cornhill Chambers, died on Monday last, in his thirty-fifth year.

**The Plans of Mr. J. E. Burton**, of Ashton-under-Lyne, have been selected in competition for the erection of a new Wesleyan chapel at Berry Brow, Huddersfield.

**The Chapter of Lichfield** have decided to reserve a niche in the cathedral west front for a figure of Dean Bickersteth.

**An Archaeological Society** is proposed to be formed for Walsall and the immediate neighbourhood.

**The Scheme** for enlarging the chapel of Marlborough College, for which a contract at about 10,000*l*. was recently entered into, has, it is stated, been abandoned. It is now intended to pull down the chapel entirely, and build a new one in its stead.

**The Albert Medal of the Society of Arts**, instituted in 1862 as a memorial of the late Prince Consort, and given annually "for distinguished merit in promoting art, manufactures, or commerce," has been awarded by the council of the society, with the approval of the Prince of Wales, the president, to Captain James Buchanan Eads, "the distinguished American engineer, whose works have been of such great service in improving the water communications of North America, and have thereby rendered valuable aid to the commerce of the world."

**The Carpenters' Company** have given 100 guineas to the International Health Exhibition; 500*l*. to the Equipment Fund of the City and Guilds Technical College, Kensington; 25*l*. to the City of London College; and 25*l*. to the Female School of Art.

**The City and Guilds of London Institute** is to receive the following contributions from the City Companies:—Fishmongers, 4,000*l*.; Mercers, 2,000*l*.; Clothworkers, 2,000*l*.; Corporation of London, 1,000*l*.; Skinners, 1,000*l*.; and an increased subscription of 500*l*. annually; Leathersellers, 500*l*.; Carpenters, 500*l*.; Armourers and Braziers, 300*l*.; Tallow Chandlers, 105*l*.; Scriveners, 105*l*.; Stationers, 52*l*. 10*s*. annually; Clockmakers, 26*l*. 5*s*.

**The East Window of Easbury Church**, Lamborne, Berkshire, has had a stained glass window, to the memory of the vicar's wife, placed in it by her husband, the Rev. G. F. Forbes. It is a five-light window in decorated style. The subject chosen is the Ascension of our Lord. The work has been carried out as regards the painting and colouring by the firm of Messrs. Ward & Hughes, of Frith Street, Soho, London, who lately executed the side window in the same church.

**The Memorial** to commemorate the celebration of the septcentenary of the mayoralty of the city of Winchester will be erected from the designs by Mr. J. B. Colson, of Winchester, submitted in competition with those by Mr. C. R. Pink, of Winchester and London. The cost will be about 350*l*.

**The Bishop of Kingston, Canada**, who sailed from Liverpool this week, per the ss. *Parisian*, has taken out forty-eight lancet windows of stained-glass for erection in Kingston Cathedral. These are the first of a series, and contain subjects from the lives of our Lord and His Apostles. They have been designed and executed by Messrs. Wailes & Strang, of Stained Glass Works, Newcastle-on-Tyne.

**The Oxford Local Board** have accepted a tender for the erection of an infectious diseases hospital from the plans of Mr. W. H. White, M. Inst. C.E., their surveyor. There will be two detached pavilions, each providing for twelve beds, a special ward pavilion for two beds, an administrative block, laundry, ambulance house, mortuary, and disinfecting house. The buildings and grounds will be enclosed by a wall 7 feet in height. The site, five acres in extent, adjoins the road from Oxford to Abingdon, about a mile from Oxford.

**Messrs. Charles Bussell, Gibbs & Co.** have manufactured the stained glass windows for the Great Indian Peninsular Railway administrative block, Bombay terminus, from designs furnished by them. Special monograms, together with the arms of the company, have been worked into the windows. The colour is rich and deep. The windows may be seen at their workshops, Nos. 75 and 76 Wells Street, Oxford Street, during the following week.

**Messrs. C. B. Pare & Co.**, of 126 London Wall, E.C., have been appointed official agents to represent British exhibitors and facilitate the transport of their exhibits to the Antwerp International Exhibition of 1885.

**Ventilation.**—Messrs. Robert Boyle & Son, of 64 Holborn Viaduct, have received an extensive order from the Russian Government for their large-size Patent Self-Acting Air Pump Ventilators, to be applied for the ventilation of the Imperial Manufactory of State Paper, St. Petersburg. This order is the result of the success of the air-pump ventilators applied to the Imperial Mint and Imperial Bank Note Manufactory, St. Petersburg, which are pronounced by the Government officials to be the only ventilators tried which have fully answered their purpose, and effectually kept out the snow in the winter.

**Messrs. Isler & Co.** have completed a 100-feet bored well, 6 inches in diameter, besides fixing and lining pipe, in a fortnight, at East Berkshire Brewery, Maidenhead. An ample supply of water was tapped.

# SUPPLEMENT

TO THE

# ARCHITECT.

LONDON, JUNE 14, 1884.

## THE INTERNATIONAL HEALTH EXHIBITION.

ALTHOUGH each week necessarily adds to the completeness of the exhibition, it is nevertheless a fact that it is not yet in perfect order. Even the Old London Street is not complete. Some of the exhibits first commenced still lack their finishing touches, while carpenters may be seen here and there engaged in the erection of new stands. It would be only waste of time to inquire into the reasons of this state of backwardness, but it is none the less annoying, and oftentimes disappointing. We never remember an exhibition in which so many exhibits are left without attendants, and we are confident that it is a mistaken economy, and that the firms who so neglect their goods are every day losing opportunities of doing business.

*Messrs. Griffiths, Berdoo & Co.*

At 873 are located the SANITARY PAINT CO. (Messrs. GRIFFITHS, BERDOO & CO.), South John Street, Liverpool. As at the annual building exhibition, held at Islington, so here, their handsome and effective stand forms a very prominent feature, and is in fact the most interesting in its class, not merely from its artistic character, but on account of the intrinsic merits of the articles exhibited. Year by year the deadly effects on the health of the operatives employed in the manufacture of white lead are brought more prominently before us, so that it is gratifying to know that the pigment manufactured by this firm, and known as Griffiths's patent white, will not only take the place of ordinary white lead paint, but in addition offers advantages that white lead lacks, it being claimed for it, and we believe has been proved in practice, that it is more economical than lead paint, for the same quantity will cover a greater surface, and it works more freely under the brush, while its durability is unquestioned. Another point worthy of note is the exceeding variety and delicacy of the tints formed from Griffiths's patent white as a basis, the merest glance at the stand being sufficient to convince one that the objection urged against this class of paint, that the bright and rich colours could not be obtained, is entirely without foundation, and even emerald greens can be supplied perfectly innocuous in their composition. Griffiths's patent white is equally advantageous for distempers as for oil paints, and some of the colours and examples of wall decoration here exhibited are all that can be desired, besides their special value from an hygienic point of view, in the pigments being all non-poisonous. We must not conclude our notice of this exhibit without drawing attention to another very admirable product of the firm, in the shape of a non-poisonous petrifying liquid for coating walls, to prevent the penetration of moisture, and for preserving bricks, stone, and such like building materials from the deleterious effects of the atmospheres of our large towns and cities. The specimens shown of varnishes, wood staining oils, &c., are also well worth attention, and complete this useful and interesting display.

*Messrs. William Woollams & Co.*

In the eastern gallery, at No. 860, we find Messrs. WOOLLAMS & CO., of High Street, Marylebone, who fully maintain their reputation as the original manufacturers of innocuous paper-hangings. To describe the many patterns they have brought here for our inspection would occupy far more space than we have at our command. We can only select the most salient features for our remarks. A striking pattern is the "Tree," depicting foliage, flowers, and birds, on a bright green ground, especially introduced as an example of brilliant colour free from arsenic. Not far from this we find specimens of the original green papers, non-poisonous,

made by the firm in the year 1859, when the agitation against the use of arsenic in wall decorations had attention first drawn to it. These colours maintain their fresh and bright appearance, notwithstanding that a quarter of a century has elapsed since they were made; their freedom from arsenic being certified by Dr. Henry Medlock, a popular analyst at that time. Raised flocks painted over are a speciality with the firm, and patent embossed flocks, washable and highly decorative in character, are both shown in various patterns, evincing great taste in the designs. Blues and old-gold colours are conspicuous, and there is a rich pattern representing Italian brocade of varied colouring, named the "Venezia," composed of no less than thirty-eight different tints, some opaque, others semi-transparent; but although only the number of tints named are really visible, it is said this example of wall decoration contains no less than ninety-four different printings. A green silk damask is no less commendable, and a dado called the "Cavendish," the frieze consisting of *amorini*, holding branches of myrtle, dancing amongst flowers, is a good conception. Next we have a chintz pattern of thirty-six colours on a blue mica ground, and then follows a dado of Jacobean character, called the "Lyre Bird," designed by Mr. Owen W. Davis, an exquisite production. Another of the brocaded type, from the pencil of Mr. Arthur Silver, named the "Chelsey," will probably find many admirers. One fine Italian pattern, called the "Tapestry," is printed in semi-transparent shades of reds, purples, and greens on a diapered mica ground, and deserves high commendation. Although we have only mentioned the high-class designs, the firm are equally to be commended for their inexpensive qualities of wall-papers, and they exhibit in addition the non-arsenical colours used by them in their business. Designs for wall-papers by well-known artists are also to be seen amongst their exhibits, which is one the jurors cannot well pass over without some tangible acknowledgment.

*Messrs. Doulton & Co.*

At the eastern end of the central gallery will be found the comprehensive exhibits of Messrs. DOULTON & CO., the decorative features of which will not readily be forgotten. Long before the exhibition opened, the costly work which it was seen the firm were building up was the theme of conversation amongst those whose business led them into the exhibition grounds. A large space has been allotted them, and they are entitled to a meed of praise for the architectural designs of the different erections, independent of the art features of which they are mainly composed. The principal object is a pavilion, square in form, from which rises a central dome, and the only drawback to its appearance is the low pitch of the roof of the gallery, the dome reaching to within a few inches of the top. This pavilion is entered by an archway on each of the four sides, and the materials employed in the erection of this work of art is either the pottery now universally known as Doulton ware, or tiles hand-painted by the artists of the firm, and others in relief. When we remember the few years that have elapsed since the Messrs. Doulton introduced this beautiful ware, that is now known throughout the civilised world, and is made into almost every article for domestic use to which pottery can be applied, and broadly speaking, from a salt-cellar to a pillar for architectural purposes, scarcely any two productions being exactly alike, we can but admire the enterprise of the firm, while according them the merit of a new introduction which will hand their names down to posterity as amongst the most honoured in the pottery art. In erecting this work of art expense has been altogether ignored, and we doubt if its exact cost is known to the firm themselves. No description can give a fully appreciative account of its many salient attributes, and any time expended by the visitor in examining its details will be well spent. Each of the four sides composing the structure are embellished with panels

of hand-painted tiles representing various interesting subjects and persons. Commencing with the north side, we find four views of old and modern Lambeth, a graceful recognition to the district in which the development of the firm's industry has been carried out. There is Lambeth Palace, replete with historical associations; High Street, with some of the quaint buildings still remaining, with the turrets of Messrs. Doulton's new buildings visible in the distance; Bishop's Walk, of which the site was swept away during the erection of St. Thomas's Hospital; and the Albert Embankment, with a full view of the noble building erected by the firm during the past few years. On the west side we have illustrations of pottery processes, including throwing and handling, turning or lathing, tile-making, and drawing the kiln. Those on the front or south side, facing the promenade, are of more elaborate character, and represent "Science" in the person of an aged man, with a large volume on chemistry, and a pupil holding up a flask of fluid to the light, while several chemical vessels are ranged around. "Western Art" shows a modeller of the school of Della Robbia, and a painter engaged upon a vase of the famous Urbino ware. "Eastern Art" is a pretty picture, and introduces us to a man "throwing" on a primitive wheel, the "posture" of the worker being in accordance with Eastern habits—a woman being engaged in painting them. The background is very picturesque, showing an Indian lattice made of glazed earthenware. The last on this side delineates "Commerce," in the person of a Dutchman offering his pottery to an English merchant, the background being an old wharf probably on the Scheldt. The east side introduces us to full-length portraits of four celebrated potters, representing France, Italy, Japan, and England. Palissy is painted in an attitude of despondency and disgust at the loss through the failure of his kiln of two choice *morceaux*. Della Robbia is engaged in fixing one of his famous architectural reliefs in an arch of the Virgin and Child. Shon-Sui, a Japanese potter, is pictured on the next panel. He is supposed to have established the production of fine porcelain in Hizen, an art he learned from the Chinese. The last panel depicts our own Wedgwood examining one of his reproductions of the Barberini or Portland Vase, which contributed so much to his fame. He who is inclined to moralise may raise in his imagination some future Layard or Schliemann in generations to come, bringing to light portions of this temple of the Victorian period, and indulging in speculations as to its origin, and the "lost art" of this celebrated manufacture. The domed ceiling is partly covered with tiles of floral decoration conventionally treated, and the four corners of the building are fitted as furnished apartments, consisting of a boudoir, library, drawing-room, and dining-room. In each of these the fireplaces and mantelpieces are composed wholly or in part of Doulton ware, the combination of wood and pottery being conceived with happy effect. Outside the pavilion and in each corner are four annexes, also supported by columns of Doulton ware, and in these are massed a collection of the firm's principal manufactures, consisting of sanitary productions, drain pipes, stoves and grates, and filters. Referring to individual exhibits in these sections, there are several new articles to be commended. The Lambeth patent "combination" closet, with which the retiring-rooms at the exhibition are supplied is one of these. It is well named, as it combines closet, urinal, and slop sink in one. An illustration of this is appended. It is made of Doulton ware, though of a less expensive character than most of the "art" ware, and is not encased with woodwork, so that all its

surroundings can be easily kept clean. The seat is hinged, and when lifted forms the slop sink, or urinal, the pan being made of the lip shape for the last-named use. The flush of water is given by the action of the seat, in connection with the firm's patent automatic flush tank and syphon, which secures a powerful discharge and retains a volume of water  $1\frac{3}{4}$  inches in depth after every flush. A new instantaneous water-heater for baths, lavatories, &c., is also shown, and the arrangements of this appliance are different from any others that we are acquainted with for a similar purpose. In outer appearance it does not differ from most others, the difference in construction resting with the interior. Its advantages consist in the gas not coming in contact

with the water, and in the absence of any coils of small piping liable to "furr" or become clogged, and a warm bath of thirty gallons may be secured by its use in less time than is usually taken with similar appliances, and being made entirely of copper rust or other corrosions cannot occur. A very cheap and neat-looking cottage pump forms another of the articles shown here for the first time. It is made of iron, galvanised or painted, and the cylinder of strong stoneware, giving it a clean and attractive look. By means of an inner lining precaution has been taken as much as possible to guard against frost "fixing" it. This pump can be sold at a most trifling price, and for a certain class of property is bound to command a large sale.

The next illustration is that of the patent automatic flush tank and syphon made by the firm in various sizes, either for water-closets, urinals, or for flushing drains and sewers. As the drawing clearly defines the action, further remarks are unnecessary,

excepting to say that of all modes of flushing the syphon action offers the easiest and most reliable, and effects the purpose far more effectually, and with a much smaller consumption of water. Water filters are shown in a variety of forms and sizes, from the small pocket syphon, for tourist or army use, to the self-cleansing high pressure, for the use of brewers, mineral water manufacturers, and other large establishments. The designs in household filters in Doulton ware are of the usual attractive appearance incident to that material, and the media generally employed for filtration is a manganous carbon. Our last illustration, though the smallest, is by no means as regards its value the least, and represents a small filter to be attached to the tap of the main supply of the house. This is a handy little appliance, and, as the filtering media can at any

time be easily removed for cleansing or a fresh supply, it offers an amount of security at a very trifling cost. In whatever form they work clay Messrs. Doulton appear to be perfect masters of the material. Thus, an example of a Late Pointed window-head of terra-cotta is perhaps as fine a specimen of work from clay treated in this manner as has ever been manufactured, and a red-and-buff terra-cotta dado for ecclesiastical use is equally worthy of commendation. A new invention of considerable merit, and likely to prove a great acquisition, is shown in the form of a silicon tread for stone staircases or steps. It is laid down on the face of a few steps leading to Messrs. Doulton's exhibit from the upper part of the gallery. The treads are made of a specially prepared clay, with small corrugations, and appear as hard as adamant. In the terra-cotta steps made by the firm, arrangements are carried out for fixing the silicon treads to them, but they can be easily adapted to any stone steps, and may be looked upon as practically indestructible. It now only remains to speak of the ladies' and gentlemen's retiring-rooms, which have been fitted up by the firm with great taste, amounting almost to elaboration, and with the utmost care as regards sanitary requirements. The cabinet-work of the lavatories was designed by their own artists, and, with an admixture of Lambeth faience, have resulted in some charming effects. The closets are all of the type illustrated above, flushed by the automatic syphon before named. The "individual" urinals are similarly treated, and flushed at periodic intervals; and there is a range of urinals, the trough being of fine stoneware, always full of water, and flushed in a similar manner. The drainage outside is open to the inspection of everyone, and the trench, instead of being filled up, has been mainly covered with tiles at sides and bottom, and a perforated cast-iron grating placed over the top. The drains are also ventilated by means of Cregun's fresh-air inlet. These arrangements enable access to be obtained at any moment by merely lifting off the cast-iron grating, when the slightest fault can be immediately detected. It would tend much to the safety of our homes if the laying of the drains in all houses were carried out upon a similar system.

*Messrs. Smith & Turner.*

At 395 Messrs. SMITH & TURNER, Bartholomew Close, exhibit a varied collection of door-springs, spring hinges, ball-door porters or holders, and kindred appliances. It is now something like fifty years since the adjustable regulating door-spring, known as Ben. Turner's patent, first saw the light, and during that period they have been extensively used, and still hold their own, notwithstanding that many others claiming to possess the same advantages have since appeared. To comment upon the advantages of an article so widely known and so commonly used as this now is would be a superfluity, but the details of Messrs. Smith & Turner's improved adjustable slam-spring may not be uninteresting. The salient feature in this is that it can be adjusted to any tension, so that when the door falls to, it prevents noise and holds it firmly when closed. A defect in ordinary slam-springs is that they allow the door to stand a few inches open, or else send it to with a bang. This is obviated in the one before us by the introduction of an adjustable screw, which can be tightened or loosened at will. An improved patent water-bar for French casements also has advantages that are worth inspection.

*Messrs. Robert Boyle & Son.*

In the western gallery, amongst the machinery in motion, at Stand 1,126, are Messrs. BOYLE & SON, of Holborn Viaduct and Glasgow. We regret that the committee were not enabled to accord Messrs. Boyle a larger amount of space. In walking through the buildings we found many things that could well have been dispensed with, and the exhibition would have benefited by the space in question being allotted to other applicants whose wares were more in accordance with the objects of the undertaking, or in extending that of firms of position such as the one we are now speaking of, who would not only have made good use of it, but would have introduced a collection of their specialities worthy of the exhibition. With the small amount at their disposal they have done the best possible. The patent, self-acting, air-pump ventilator, that has fought so many battles and gained such successive victories for the firm, seems ready to enter the lists again, and appears as confident of success. We must remind our readers that Messrs. Boyle made another important reduction in the price of these ventilators in October last, which enables them now to be used on the cheapest class of buildings, the prices being now about 40 per cent. less than they originally were. Messrs. Boyle's patent air-warmer and air-cooler are also shown, and are likely to prove as successful appliances as the air-pump ventilator. An inlet tube, in the form of a bracket, which may be made as ornamental as desired, contains a tube of zigzag form, as shown in the accompanying illustration, over and around which the fresh air from the outer atmosphere has to pass before it is admitted into the room. A small atmospheric gas-burner, it will be observed,

is fitted at the lower end of the pipe, which, after traversing it, discharges its products into a condensation box shown at the bottom in the left-hand corner, the pipe being continued upwards into a ventilating shaft or flue. With this simple appliance the temperature of incoming air can be raised to 130 degrees at a cost of less than one farthing per hour. The Reform Club has been successfully treated with these heaters. There is no doubt they effect most favourable results, even when compared with more elaborate and expensive modes of forcing fresh air into rooms. In contradistinction to the air-heater, we have the air-cooler, which is likely to prove as beneficial in crowded and heated apartments in

summer as the air-heater in winter. The arrangements are somewhat similar; but in place of the coil of tubes we have a draw divided by means of wire-netting, and packed around the side with a non-conducting material. In the chambers formed by the netting block ice is placed, and the air on entering passes through the channel in the direction of the arrows shown in our illustration,

and is admitted into an apartment in the usual manner, a valve regulating the supply. The soil-pipe ventilator that has also proved so valuable for this purpose forms another item in the exhibit, and these are now made as low as 15s. Mr. Boyle also shows his economical system of ventilating workmen's cottages, which we described in our report of the late Building Exhibition at the Agricultural Hall. The rest of the exhibit is mainly composed of modifications of the firm's inlet and outlet ventilators, shop ventilators, &c.

*Messrs. Engert & Rolfe.*

At Stand No. 823 Messrs. ENGERT & ROLFE, Barchester Street E.C., have a compact and well-assorted exhibit of their various specialities in roofing and other felts, damp-proof courses, &c., for the superiority of which they stand unrivalled. They have a model roof showing four different ways of laying the felt, as circumstances may require. One is illustrative of the non-conducting hair felt; another shows the method of lining for ordinary roofs; another the inodorous felt for laying under slates; and, lastly, their extra stout asphalted felt for the outside covering of roofs, gutters, &c. The most salient features of this asphalted felt are that it can be easily applied by an unpractised person, and, from its lightness, considerably less timber is required in the construction of the roof. It is perfectly impervious to wet, a non-conductor of heat, and has been found to stand well in all climates. As a ceiling to iron roofs it is very applicable, counteracting heat, frost, and condensation of moisture.

*Messrs. Hodgkinson & Clarke.*

It is to be regretted that the bulk of the educational appliances have had to be consigned to the top gallery in the Albert Hall, and we have no doubt that a large number of the visitors do not see them at all. On the other hand, it may be fairly assumed that, as it is generally known education forms one of the divisions into which the exhibition is divided, those interested in the question will take care not to miss them, but, nevertheless, the journey to the Albert Hall, notwithstanding the advantages of the "lift," is one that we would have rather seen eliminated from the programme altogether. Large as this gallery is, too, the committee have in some instances been sparing in their allotments as far as space is concerned, and Messrs. HODKINSON & CLARKE have not been enabled to make the display they would have done had more room been placed at their disposal. The exhibits consist of a similar lot of educational appliances such as were shown at the building exhibition at the Agricultural Hall, and which were mentioned by us at that time. We observe, however, one new appliance that the firm has just added to their many useful school fittings, and one that both teacher and pupil should thank them for. The article in question is an improved blackboard, which by a simple arrangement can not only be turned to any angle, but completely round from front to back, enabling side or back sitters to have as full a view of the demonstration as those directly in front. The home educational seat and desk is again exhibited here, a very nicely-finished example in polished mahogany being the "representative"; and we have the many other seats,

desks, &c., including the Kindergarten instructors that the firm have recently introduced. One improvement the firm have introduced into some of their fittings is very noteworthy. Whenever cupboards or shut-up divisions in any article are necessary or an addition to it, in place of a door that sometimes cannot be opened without the removal of the person or papers, &c., Messrs. Hodkinson & Clarke introduce the revolving shutter or blind, which, as they are extensive manufacturers of, they are enabled to do with greater facility than some of their competitors. The portable class-room division, to which we have also alluded, forms another conspicuous item in the collection. Being comparatively a new invention, it is not so widely known as its merits deserve. Here, at all events, it will have the advantage of being seen by all those engaged in teaching at South Kensington, and whoever the judges may be who are deputed to pass their opinions upon the educational appliances, they can scarcely pass the new features on this stand without substantial recognition.

*Messrs. Clark, Bunnett & Co.*

Among the model buildings erected in the grounds, one put up by Messrs. Clark, Bunnett & Co., Rathbone Place, W., calls for special notice. It stands in the space south of the south gallery, and is an example at once of strength combined with lightness and ornament, and shows to what extent iron alone can be, and is, advantageously and economically used for building purposes. The form is rectangular, the shape being defined by ornamental iron columns placed at suitable distances apart, and which support the roof. The front, back, and sides can be open or closed in according to desire, as the firm's patent folding iron, steel, and wood shutters are fitted all round, and, when drawn down, do duty as the walls, thus making the structure most convenient and secure. The roof is composed of corrugated iron laid on iron rafters. Passing to their Stands (Nos. 376 and 874) in the central and east central galleries, we find specimens of the appliances for which Messrs. Clark, Bunnett & Co. are justly noted, such as their dinner and goods' lifts, fitted complete in several sizes, the salient features of which have often been alluded to in the columns of *The Architect*. A portion of a somewhat massive iron staircase shown here is well designed and of a very ornate character, while the spiral and lighter make of iron staircases are up to their usual standard. The specimens shown of their system of constructing solid fireproof floors with a floor-board surface are of great merit. It has been very largely used in the construction of the new St. Pancras workhouse.

*Mr. Henry Conolly and Messrs. W. Phillips & Son.*

In the central gallery at 375, in two commanding bays artistically built and coloured in white and gold intersected with panels of painted and stained glass, are the joint exhibits of Mr. HENRY CONOLLY, Hampstead Road, N.W., and Messrs. W. PHILLIPS & SON, Baker Street, Portman Square, W., the building having been erected and decorated by the last-named firm. A portion of the space devoted to Mr. Conolly's exhibit is apportioned to a bathroom, fitted up in a luxurious manner. The flooring is laid with cork in the style of parquet, which gives a warmth that the ordinary coverings cannot supply. The walls and ceiling are decorated in the Pompeian style, taken from Zahn's examples of decorative remains in Pompeii, in this instance the Casa del Poeta. The work is executed in non-poisonous and washable materials, and is all hand-painted, the execution being of the highest order, and sufficiently good for the most costly furnished drawing-room. The appointments in this room are quite in keeping with the decorative features, the principal one being an elaborately mounted bath of enamelled copper, in a casing of fine cabinet work, composed of walnut, amboyna, and Tuhya wood, and embracing arrangements for shower, douche, needle spray, wave, sitz, &c. The lavatory is of the same wood, the top of Portuguese Fleury marble, a shampooing appliance attached to the basin, and a handsome square, bevelled-edged looking-glass above; the dressing-table *en suite* holds a swing glass, and contains drawers for jewellery, &c.; and the chairs match the other articles of furniture. The gas brackets are of a design in accordance with the decoration. A notable feature in this room is the perfect arrangements for ventilation. The cornice is pierced all round, and conceals here and there a small gas jet, while horizontal and vertical tubes are carried to the outside, or to a main ventilating shaft. Whenever the bath is to be used the gas jets are lighted, which, providing an induced current, drains off the steam and heated atmosphere. The other portion of the bay is devoted to general goods, amongst which is exhibited a bath of similar construction to the one before described, and known as the "Universal." This bath is produced at a price which brings it within the reach of every householder. There are several lavatories of good design, with water fittings of the most approved make; and there is an ingeniously-formed concealed lavatory and urinal, admirably adapted for a gentleman in chambers, library, &c. A choice selection of gaseliers, hall lanterns, &c., are suspended from above, and the wall is decorated with some very pretty mirrors in *repoussé* frames, holding gas brackets, the burners being made to represent coloured wax candles. Several specimens of stained-glass panels, suitable for doors, blinds, &c., are ranged around, and

the ceiling is ingeniously constructed of panels of a similar description, of the most varied subjects, and ranged in angles, which have a charming effect. By the side of this bay, and hid from gaze, is a collection of lavatory ware richly embellished, small drinking fountains, a variety of handsome closets, including Mr. Conolly's last two patents, the "Nestor" and "Safety" valve closets. This drawing illustrates an improvement in the trap of a

closet, which admits of the outlet being placed in such a position to suit the soil-pipe. This object is attained by means of a collar, which is similar in shape to that of an ordinary valve closet; the base of the collar being round is flanged A; this is attached to a corresponding flange B, formed on the end of trap by means of screw bolts, and from the drawing it will be seen that the outlet can be fixed in any position. It is obvious that this system can be adopted in every case where a separate trap is employed. The "Safety" valve water-closet, like the "Nestor" as regards the basin, is made with a cast lead trap above the floor line. The trap is constructed so that the water-line is within  $1\frac{1}{2}$  inch of the seating of the closet; therefore, it will be seen, if there become any defect in the india-rubber seating, the trap still remains sealed. By this means the necessity of a ventilating pipe is dispensed with, also the old system of having a weeping-pipe from the supply to the lead trap fixed in the box of the closet, there being no space for the generation of gases. The overflow arm is also protected from the possibility of soil corroding the edge of pipe, as the clack is made to open against it. There are also exhibited syphon and other water-waste preventers, another speciality of the firm, and a general assortment of plumber's fittings. Amongst these may be mentioned some large and bold cast lead rain-water heads, suitable for public buildings. These are notable for their capacity to receive large bodies of water in the event of heavy storms, and to prevent overflow. In this department an improvement in connection with public urinals, which consists of a half circular sheet of thick glass of the entire size, which is fixed in front of the slate, and insures greater cleanliness. Mr. Conolly's exhibit cannot be approached by any other of its class in the building, and the wall decoration in particular excels anything in the furnished rooms exhibited.

In Messrs. PHILLIPS & SON'S bay the walls are hung with a variety of designs for the decoration of apartments, halls, staircases, &c., which constitutes one of the principal sections of the trade of the firm. A portion of these designs represent works that have been executed, while others are suggestions for different styles of decoration. Although occupying a high position as decorative artists, Messrs. Phillips & Son are no less notable as sanitary engineers and plumbers, and fine specimens of plumbing showing "wiped" joints occupy a place in the exhibit. Of a more comprehensive character are some well-executed models on a rather large scale, showing the complete drainage arrangements necessary for a large suburban house; another of some business premises in Oxford recently completed in their sanitary arrangements by the firm. These models show the entire ground area of the houses, and every pipe, gulley, &c., is shown. That of the business house introduces us to a system of drainage all contained within the premises, and shows how easy it is to provide security against sewer gases in confined places when skill and care are introduced. These models will no doubt receive a great deal of attention, and a little time expended in examining their details will prove instructive to the general householder, as well as to the professional man. As we observed at the commencement of these remarks, the design and decoration of these stands have been carried out by Messrs. Phillips & Son, who have been highly complimented on all hands for the amount of taste displayed.

*Messrs. Broad & Co.*

No. 503 is occupied by Messrs. BROAD & CO., South Wharf, Paddington, who contribute a useful collection of sanitary ware.

Of these their registered improved inspection gully calls for first attention. It is shown in a variety of sizes, and is well adapted for the purpose for which it is intended. Field's channel syphon is another *spécialité*, and judging from its construction, which is sound in principle, should do its work efficiently. An excellent assortment of glazed and enamelled porcelain ware, also shown at this stand, should not be overlooked. It comprises mangers, corner-mangers, butlers' sinks, washing-up tubs, and milk-coolers. Some of the latter are of large size, and as specimens of quality and good workmanship better could not be desired. The well-known glazed bricks of Messrs. Ingham & Sons, of Leeds, are also shown by Messrs. Broad & Co. in their various colours, and tend to render the stand attractive and the exhibit complete.

*Messrs. Jenks & Wood.*

No. 379.—The space allotted to Messrs. JENKS & WOOD, 65 Holborn Viaduct, is in a very advantageous position, and, from the arrangement of their exhibit, it would seem they have not been slow in appreciating it. It is situated immediately on the left-hand side of the entrance to the central gallery, the one devoted to this class, as one approaches it by the avenue passing the Prince of Wales's pavilion and "Bishopsgate." The stand is of white painted wood, and it alone, from a decorative point, is highly creditable. The goods divide themselves into two heads:—Artistic furniture, wall decorations, floor coverings, &c., and furniture and appliances for the sick room, the former occupying two compartments, the latter one. The style followed in the construction of the stand is Queen Anne, and the interior decorations are of the same character, the whole being commendable on account of the purity of design. A mantelpiece and over-mantel in white painted wood, fitted with Venetian mirrors, is an exceptionally choice reproduction of the above style, and, as regards finish and workmanship, all that can be desired. Less cannot be said of a painted cabinet and chairs of fourteenth-century design, notably an arm-chair in white, upholstered with a rich brocade consisting of flowers and foliage gracefully wrought on a grey ground. A piece of modern French reproduction, also of fourteenth century, in the shape of an *escritoire*, is worth notice, and in appearance is equal to what at the late Hamilton sale went for thousands. Specimens of well carved dark oak and walnut chairs, after the Italian, are also shown; and a piece of deep walnut panelling, with Japanese leather above, renders one of the walls very attractive. The object sought in the furniture for a sick room, as also in the room itself, is to dispense with everything of the nature of angles or corners that would harbour dust or dirt, &c.; for instance, the angle formed by the skirting and the floor-boards is filled in, and forms, as it were, a hollow moulding, capable of being perfectly and easily cleansed. The furniture is very simple, all kinds of hangings being discarded, and, while not forgetting the object in view, is by no means of an unattractive character. The firm have supplied it to many of the middle-class or paying hospitals throughout the country.

*Messrs. Tuberville, Smith & Son.*

At Stand 403, Messrs. TUBERVILLE, SMITH & SON, of 9 Great Marlborough Street, W., have an erection that possesses interesting and exceptionally uncommon features. The firm are well known as importers of foreign carpets, matting, and the like; and their stand, which represents a smoking-room in the Oriental style, is replete with such articles, as well as a variety of ottomans, couches, &c., of Eastern manufacture. The front is composed of Cairene woodwork, said to have formed a portion of an old house in Cairo. It is in a good state of preservation, and no doubt possesses considerable attraction for those who can admire the style as well as for the ordinary sightseer. Inside, at one end of the room, is a fireplace, fitted to which is a screen surmounted by a canopy, the whole doing duty as a mantelpiece and over-mantel. It is decorated in blue and white, *en suite* with its surroundings, but looks very much like a portion of a summer-house let through the wall; but there are doubtless some Englishmen to whom it will give satisfaction.

*Messrs. H. J. & C. Major.*

At 836 is to be seen a collection of roofing tiles that probably possesses more interest, when one comes to know the salient features of it, than any other of its kind here shown. The exhibitors are Messrs. H. J. & C. MAJOR, of Bridgwater. Most of our readers are aware that this town is the home of the roofing tile industry, and it is well known that in other parts of the kingdom patterns that have originated here are made and sold as Bridgwater tiles, on account of the reputation this town has acquired. The firm have recently patented an invention that is adapted to all Bridgwater tiles, and is the prominent feature to which we would draw especial attention. The object of the patentees is to render nailing-down unnecessary, and to make the tile completely weatherproof, and in addition to make it non-absorbent. They have no cut or unprotected corners, but each is secured from leakage by the formation of a "rib" or "web" across the face of the upper or top end, and a corresponding one underneath the lower end, and upon close inspection it is pretty obvious

that it is impossible for rain, snow, or wind to penetrate. As regards the non-absorbent properties of the material, this is attained by subjecting the clay to an enormous pressure, which binds the atoms together so as to render the mass quite impenetrable; this is done with a steel die that impresses the pattern at the same time.

*Messrs. J. Warner & Sons.*

No. 511 is occupied by Messrs. J. WARNER & SONS, of the Crescent Foundry, Cripplegate, E.C. We naturally expect to see from a firm like this, who have gained such a high reputation, and whose connections are world wide, a display that redounds to their credit, and must record our disappointment at finding what for them is certainly a meagre collection. Upon a close examination of their stand, however, it is evident that for the reason of this one has not far to seek, and is only another case of the inability of the executive to grant exhibitors the amount of space they required, a reason that in more than one instance has prevented many exhibitors from being present at all. As we have just remarked, though, a close inspection will show that Messrs. Warner have not been slow in grasping the situation, as it would require a great amount of ingenuity to arrange a more representative assortment of their manufactures in the limited space allotted them. In the centre of the floor of the stand are one or two good baths, and arranged on either side many specimens of their excellent pumps and pumping machinery, all of which have points that will well repay an examination, while placed among them, as opportunities have occurred, are water waste-preventers, flushing cisterns, and waterclosets; of the latter, an apparatus known as the "Villa Valve Watercloset" calling for special notice. At the back are to be seen several well-fitted lavatories, an almost endless variety of water and steam fittings, heating apparatus and ventilating cowls. Lastly, we have a goodly display of copper cooking utensils, tea urns, and general braziers.

*The Patent Victoria Stone Company.*

At Stand 477 THE PATENT VICTORIA STONE COMPANY have taken up a prominent corner position that cannot fail to be noticed. Though the entries of artificial stone and concrete dressings are not particularly numerous, this company, by the variety of articles they show, have to some extent made up for the absence of other firms, and have determined that sightseers and other visitors shall be made acquainted with the different purposes for which this material has of late been so much used. At the back of the stand a number of heavy slabs such as are used for railway platform copings and similar heavy work are piled one on the other, and look very imposing, the top one being worked to show the composition. Then there are specimens of the lighter slabs as used for ordinary street pavements, &c. Arranged in front of these are samples of more strictly architectural character, as string courses, pilasters, columns, stair treads, wall copings, &c., not forgetting such things as garden vases, while an assortment of channels, sinks, and other sanitary appointments make it a very useful exhibit.

*Messrs. Hindley & Sons.*

In the complete-fitted apartments Messrs. HINDLEY & SONS, Oxford Street (380), central gallery, have a tastefully-arranged boudoir of Queen Anne character. The walls are panelled, and have pure white borders or divisions in distemper, the panels themselves being filled in with a rich Japanese washable paper. The mantelpiece and cabinet over-mantel of wood are of chaste design, and also white, the ceiling, finished with small panels, being the same in colour, and a prettily-painted frieze representing a rookery completes the wall decoration. The mantelpiece is furnished with a neat brass-fronted grate, brass kerb, &c., and tile hearth of suitable design. The chairs are covered with a slate blue silk, with floral decoration, representing last-century designs, and the curtains are of chintz minted from old blocks in possession of the firm, that have been renovated for the occasion. An oak parquet floor and Turkey rug complete the little bijou chamber.

*Mr. J. Kaye.*

Stand 385 is in the vicinity of these patent window appliances and fastenings, and about it considerable interest appears to be evinced. This will be readily understood when we mention that the exhibitor is Mr. JOSEPH KAYE, 93 High Holborn. To point out the particular points in which the articles of this firm differ from all others of their kind would only be to repeat what we have already said on more than one occasion—and quite recently—in our columns. But though they may be said to be now well known to professional men and others more or less engaged in the building trades, it is quite obvious that there are numbers of laymen who have up to the present no idea of their existence, and we are glad to find Mr. Kaye embracing the opportunity of placing before the public his patent indestructible locks and latches and fastenings, that are leading the van in this important industry. They are here shown in their various adaptations for front doors, swing doors, sitting-room doors, cupboard doors, ships' use, &c., as well as a very elegant and well-designed assortment of knobs, handles, finger-plates, &c., for use in connection with them.

INTERNATIONAL SMOKE ABATEMENT EXHIBITION,  
SOUTH KENSINGTON, November 1881 to February 1882.

The Judges have again conferred  
THE HIGHEST AWARD, THE SILVER MEDAL,  
To E. H. SHORLAND,

For the patent first-class Smoke Consuming and Warm-Air Generating  
MANCHESTER GRATE, "at the above Grand International Contest,  
in competition with the principal leading Manufacturers of the World."  
—N.B. Vide *Daily Telegraph*.

HOW TO WARM A HOUSE IN WINTER  
AND COOL IT IN SUMMER

BY MEANS OF THE

# PATENT MANCHESTER WARM-AIR GENERATING GRATE BACK

APPLICABLE TO EVERY FRONT GRATE IN CONNECTION WITH

## SHORLAND'S PATENT SYPHON PIPE ARRANGEMENT,

Supplied either with or without Branches for the Regulating of Warm or Cold Air to Rooms.

INTERNAL ELEVATION.

Build in pipes for warm air in the breast of chimney, just inside the  $4\frac{1}{2}$  brickwork of front of chimney breast; as building progresses, leaving the chimney breast open, say 4 feet high, till house is ready to receive grates, then build all in together.

SECTION

By this very simple Arrangement

### TWO BEDROOMS ARE WARMED,

In addition to the Room in which Fire is situate, in ground-floor rooms, or when contiguous to Room in which Grate is fixed.

### HALLS OR CONSERVATORIES WARMED.

21 BENNET'S HILL, BIRMINGHAM:  
October 27, 1881.

The Manchester Grates are acting exceedingly well, and I consider them admirably adapted for heating a small Greenhouse, as in my case, adjoining the rooms in which they are fixed.

Yours truly,  
C. A. EDGE, Architect.

LEBANON, ROSS:  
October 17, 1881.

The Manchester Grate fixed in the Board Schools here answers well.

Yours truly,  
THOS. BLAKE, M.P., Chairman.

GREAT CROSBY, NEAR LIVERPOOL:  
October 17, 1881.

The Patent Manchester Back fitted behind the old grate in my dining-room answers remarkably well in thoroughly warming my bedroom, over.

Yours, &c.,  
W. S. STEPHENSON.

#### Latest Testimonial.

Received from W. B. TATE, Esq., M.D., Medical Superintendent,  
COUNTY ASYLUM, NOTTINGHAM:

April 30, 1883.

Dear Sir,—I am much obliged for your reply to my letter of the 26th inst. I am glad to be able to speak most favourably of your Manchester Grates fixed at this Asylum. They warm the large rooms in which they are placed and the dormitories above most satisfactorily, and I am much pleased with them.

Truly yours,

Mr. E. H. Shorland. W. B. TATE M.D.

These Patent Syphon Pipes are made so that they can be kept in chimney breast, from 18 inches up to 6 feet apart, and then by this arrangement 6-inch Clay Pipes may be used at about 9d. per yard for the warm air being carried up into the Bedrooms, &c.

In rooms of great length, such as H.M. Barracks, Keyham Harbour, Devonport, the warm air deliveries are from 10 feet to 20 feet apart, the warm air by this arrangement being more equally distributed.

E. H. SHORLAND, The Manchester Grate Works, St. Gabriel's Works, Manchester.

DIPPING BURNISHING, AND LACQUERING DONE FOR THE TRADE.

**HOUSEMAIDS' SLOP SINKS.**

THESE Sinks are manufactured in plain or enamelled slate of various sizes, so as to fit the place they are required to be fixed, and may be placed in any angle or recess as required. Their chief use is to stay the necessity of throwing refuse down the water-closet, which is so often the result of causing stoppage, and is provided with a hopper and trap, the hopper being protected by a grating which allows water to flow away, retaining only improper substances. Every Sink is provided with a Supply Valve, either Hot or Cold, or if it is required both can be fixed; and a hinged slab is also fitted either in wood or slate, which admits of anything being stood on for any purpose that may be required.

**PRICES.**

**W. H. LINDSAY & CO.,**

PADDINGTON IRON WORKS, LONDON, W.,

AND SANDYMOUNT FOUNDRY, LLANELLY, CARMARTHEN.

**PATENT WROUGHT-IRON SASHES AND WROUGHT BOSSES**

SPECIALLY ADAPTED FOR WAREHOUSES, SCHOOLS, AND PUBLIC BUILDINGS.

CABLE LIGHT

The Patentee begs to call particular attention to the great strength of this construction. The Bars and Bosses, being of malleable wrought iron, form an exceedingly firm joint at the intersection of bars. They are durable, and of light appearance, the Bosses being small and not unsightly. They can be made at very short notice, and at the price of an ordinary cast iron sash.

PRICES UPON APPLICATION.

CABLE LIGHT.

CLOSE BAR SASH, obviating use of Window Guards.

ORDINARY WAREHOUSE AND SCHOOL SASHES.

Back view of Boss, full size.

Section through Boss, full size.

These can be glazed flat, like ordinary wooden sashes, without the corners of the panes being chipped off.

Front view of Boss, full size. Obscuring no appreciable light.

# The Architect.

## THE ARTISTIC PUBLIC.

HERE is in every community which has any pretension to education in these days a certain section which may be called, and often is called, the artistic public. At the present moment it is one of the most promising characteristics of English society that this artistic public is advancing rapidly in numbers, in intelligence, and in influence both at home and abroad. It is not merely that larger crowds of people are found to visit the orthodox Academy Exhibition. Nor is it that another company, smaller but more enthusiastic, is to be found every day in the week at the heterodox rooms of the Grosvenor Gallery. Neither need we refer particularly to the enthusiasm of the "dispersions" at CHRISTIE'S, or to the continually increasing number of the picture-shops which, under various imposing names, are taking possession of St. James's. All these incidents take their part in the general scheme of progress, no doubt, but they do not constitute that scheme. The English people are not being led by professional influences towards the recognition of art; they are steadily acquiring tastes whose demands the professional influences do not always find it easy to answer with sufficient readiness.

But shall we ever have in England—or, say, in London, or even in the West End of London—such an artistic public as shall, to some extent, give the law to the authorities and the Legislature? Is it to be supposed that the people at large, through their representative bodies, will ever think it right and proper to regulate the public expenditure in such a way as to introduce the encouragement of art amongst political purposes? To put the inquiry even more simply, or more modestly, how long may it be before the artistic public of London will manifest sufficient interest in public monuments, buildings, and decorations to compel those who happen to have charge of them to submit their proceedings to general criticism beforehand, instead of defying it afterwards? All such questions, we need not say, are reducible to one form, which is this:—When will the opinion of cultured people at large, which has already assumed a definite control over many things quite as difficult to deal with, feel able to assert authority over the development of the artistic work of the country, as one of the chief elements of national prosperity? It is impossible to press this too urgently or too plainly in these days.

There is one somewhat cynical answer which may be offered freely, indeed glibly enough. The taste of the public is making progress, it may be said, undeniably, but in a desultory and almost frivolous way, seeming to be very much like the wind that bloweth where it listeth, no one knowing whence or whither. To say nothing of proceedings at theatrical performances, fancy fairs, dancing parties, and many other such demonstrations more or less above or beyond criticism, we find a little multitude of the most private of private houses, which used to be laid out upon a strictly comfortable and domestic plan, for living in and nothing but living in, twisted now into one odd form after another, more for showing off in than anything else—showing off quaint architecture, quaint furniture, quaint pictures, decorations, ornaments, even quaint dresses which the ladies consent to wear and call fashionable in order to fall in with the whole histrionic game of equipment. But where is all this to end?

It is to end, we take leave to answer, in the formation of a new artistic public; or rather, if it is to accomplish this result, and then appear to end nowhere, we may be perfectly satisfied. The popular fashion in art, it must be confessed, does not seem to aim just now at anything very classically or delicately refined; if the more elegant spirits of the world, at home and abroad, call it a little coarse, the impeachment can scarcely be denied. But is not this what ought to be expected? When we come to look candidly at ourselves as a nation, is it not very plainly to be seen that the multitude of us is composed of somewhat rude islanders, who have been living for all these ages very much out of the way of the world's intercourse,

except in trade, and who, now that one rejoices to see them acquiring culture and taste, must really be allowed, not only a reasonable time for learning the lesson, but a little liberty in spelling it out in a rough-and-tumble way of their own?

A national taste is acquired very slowly in any case; even a mere improvement in style of design takes many years. So plainly is this the case that it seems to be a question whether the progress of such a movement does not in reality consist in the simple process of letting one generation die off and another grow up, until, like the three generations that make a gentleman, several generations, according to circumstances, may make an artistic public. Now, there is at the present moment, as everybody admits, a very decided change indeed going forward in English taste. Our young people of the æsthetic or artistic order are quite entitled to regard their fathers and mothers as authorities obsolete, even when those fossils in their day looked upon their own progenitors in the same scarcely respectful light. That the little people who are now in the nursery will still carry forward the principle in their turn is so far perfectly certain that this is what we rejoice in with enthusiasm as the progress of modern times; a progress to which we are not disposed to allow any discernible limits. It may not be quite agreeable, perhaps, to Mr. RUSKIN, Mr. BURNE JONES, Mr. WHISTLER, and others, to reflect that the time is rapidly approaching when their bright new candlesticks will be put out of their places, but such is their destiny beyond all question; there is nothing so certain to happen as the unexpected, even in artistic neology, and to this complexion must the mightiest of prophets come at last. When the new artistic public of Mr. RUSKIN's dreams arises in its strength, what is it likely to care for Mr. RUSKIN? Every generation of us, if the truth may be told, cares only for its own pre-eminence, and kicks down the ladder—except now and then for curiosity's sake—by which it has achieved its rise.

Setting aside, then, in what wholesome and magnanimous way we can, all personal and individual considerations, and looking with a single eye at the great stream of national progress, we may well be gratified in England to see that element in the social system which we call the artistic public increasing as it is both in volume and in quality; and, if the idea may be once more repeated, we may well consent to accept whatever little eccentricities an extremely practical people may happen to exhibit in developing a feeling which in so many respects is to them a new sensation. Indeed, such of us now living as consider ourselves to be for various reasons before the age—being of course very frequently considered for the same reasons to be behind it—and therefore are inclined to indulge in impatient opinions about the Queenannery, for instance, that is going on around them, will certainly not live long enough, as matters go, to see the world so very wise as they could wish, and must either learn to bear with human nature or go on grumbling to the end. It is a theory that will bear a good deal of looking at when it is suggested that even the wildest and weakest efforts of our Queen Anne work, and the least robust of our manifestations of homage for Netherlandish *bric-à-bac*, contain in them the latent elements of a vast development of art on almost new lines that will be English lines. Great enterprises have small beginnings, and, even if the sometimes whimsical and frivolous struggles of our æstheticism were a smaller beginning than they are in any intelligible direction towards greatness, let us not misunderstand the matter; there is an indisputable earnestness in even the feeblest of it all which bespeaks success in some form, and in a form which when the time comes cannot be otherwise than worth waiting for.

The artistic public, such as it is, is beginning to acquire considerable authority already; but, before it is able to constrain men of business in high places to pay attention to the claims of art, it must at least attain to a character of greater repose. It would be scarcely provocative of general respect if the Metropolitan Board were to be under the presidency of Mr. OSCAR WILDE, or even if the House of Lords were to acknowledge the leadership of Baron TENNYSON. But no amount of teaching, or of preaching, will make the world move more quickly than it can. It is enough for us to be able to rejoice in the daily advance that is being made, and to feel that our most sanguine hopes have every appearance of being abundantly realised all in good time. All the while, if we need not be more impatient than we can help, let us still be as impatient as we must; even our impatience is part of the programme.

## THE PARIS CARPENTERS.

ONE of the most influential trade associations in Paris is the *Chambre Syndicale des Ouvriers Menuisiers en Bâtiments*, or, in other words, the Society of House Carpenters and Joiners. It not only watches over the interests of the workmen and supports them in disputes with employers, but also undertakes the technical education of apprentices. In some respects it is like an English society; but in others, as will be seen, there is a vast difference. The operations of the society are almost unknown in England, and seem to have escaped the notice of the Commissioners on Technical Education when they visited Paris. Some account of the statutes may accordingly have interest. In their present form they were voted at a general assembly of the members, which was held in July 1882.

The preamble states that, in presence of the accumulation of capital in the hands of privileged people, and considering that the portion allowed to the labourer by those detainers of capital is illusory and renders existence almost impossible to the true producers of wealth and their families, co-operation is necessary. A coalition of operatives is required to resist the efforts of the coalition of capitalists by which labour is now menaced. The condition of affairs is too grave to sanction a scheme of partial co-operation, or one limited to Parisian workmen. Trade co-operations cannot remain isolated without prejudice to their common interests. It is the power derived from association which enables the workman to enjoy his wages and to keep the amount up to a legitimate standard, and by it alone he may aspire to be benefited by an economic emancipation. The Syndical Chamber therefore at the outset affirms the principle of solidarity, and in order to aid in its universal acceptance declares that every working carpenter, whatever may be his nationality, is eligible to become a member of the Paris society.

The first article of the statutes states that the society is to be constituted entirely of carpenters employed on buildings, who reside in the department of the Seine, and accept the regulations of the society. There is to be no distinction of age or nationality. The number of members is to be unlimited. But any member who becomes an employer or a dealer will thereby be considered as having resigned his membership. The sum to be paid on entering is 1 fr. 75 c., which includes the subscription for the first month. The subscription is 1 fr. a month, which can be increased in case of an emergency, and on the decision of a general assembly. The subscriptions are to be paid to the receivers at the hall on the days of meeting, or at their houses at specified times. A member of a provincial society who may come to work in Paris is admissible without payment of the entrance fee of 75 c.

As the society was founded in order to watch over the moral and material interests of the trade, the statutes enjoin that its efforts are to be directed in the first place so as to insure that the rate of wages shall be in a relation to the needs of the journeyman; it is to march always in the way of progress, and to seek by a study of the organisation of labour for the most equitable means to assure the existence and procure the happiness of workmen. Technical classes are accordingly to be opened, and a library formed for the use of members and apprentices. The society is also to give attention to the election of *Prud'hommes*, or tribunal of experts, which deals with matters in dispute between masters and men, and is one of the most useful of French institutions. Many strikes have been obviated by the Council of *Prud'hommes*. The society is to aid in every way that is possible in founding syndical workshops, and it may be remarked that contracts for public works are often undertaken. It is also to enter into relations with the other trade societies, and to support them on the condition of reciprocal support.

The syndicate of the Carpenters' Society is constituted as follows. There is a council of fifteen of the members who are elected by ballot at the first meeting held in January; and, secondly, a committee of control consisting of five members. The syndics are elected for a year. At the July meeting eight members (who are drawn by lot) are supposed to retire, but can be re-elected. A retiring member of the council is always eligible for re-election, but to make the nomination complete, the presence of the candidate at the meeting is necessary. All the members of the council are held to be equally responsible for the administration of the

affairs of the society. The officers of the society are selected by the council, and consist of a secretary, an assistant secretary, a treasurer, and a finance commission of five receivers or collectors. Each one of these officers is held to be legally responsible for the acts and functions which are confided to him by the council. The duties of the council consist in the enforcement of the statutes, in receiving and investing the funds, and distributing them to the members who are entitled to be recipients. The council has charge of the meetings, convocations, elections, arrangement and publication of reports upon the affairs of the society, the admission or rejection of demands and claims, &c. If any cases should arise for which no provision has been made in the statutes, they are to be determined by the council, but subject to rectification at a general assembly of the members. The secretary is to prepare the official reports of the general meetings, to attend to the correspondence, which is always to be communicated to the council; to take care of the archives, for which he is accountable, &c. Every document which bears the name of the society is to have the official seal of the syndics. Thrift is characteristic of French institutions, and all the money that is placed in the hands of the secretary is a sum of thirty francs, with which he is to meet the charges of the office and to defray unexpected expenses. The assistant or adjoint secretary is to prepare the minutes of the council meetings, and is to replace the secretary should the latter be absent. In order to facilitate reference it is directed that reports, minutes, letters, and other documents which relate to the affairs of the society are to be marked with a number and registered.

The treasurer is responsible to the council for all money entrusted to him. He is to take the subscriptions from the collectors, and is specially charged with the accounts, which are to be kept in good order and in the clearest way. There is to be an account of receipts and expenses, besides the register of general subscriptions. Another book is to show the receipts and disbursements in connection with the technical classes. A receiver is to keep a book containing the names and addresses of the members of his section, from whom he collects subscriptions. He is bound to report any irregularity in the payments. The receivers are to attend the general meetings, and at the first meeting of the council following a general meeting they are to render an account of their receipts to the treasurer, who will deposit the money in the chest of the Syndicate. The three keys of the chest are to be kept by the secretary, treasurer, and a member of the committee of control. The treasurer and collectors are obliged to present their accounts at any time on a requisition from the council or committee of control. The auditing of the accounts is the duty of the committee of control, who are to prepare a report on the condition of the society, which is to be presented at the opening of the meeting. One member of the committee is expected to assist at the meetings of the council, and has a voice in the deliberations. Three members of the committee retire at each quarterly assembly, and in order that there may be no collusion, they are not eligible for election during the ensuing quarter. A man cannot be elected on the committee of control unless he has been a member of the society for at least three months. The quarterly assemblies are to be held in January, April, July, and October.

The Syndical Chamber, as we have said, is charged with the defence of the interests of the members of the society. Whenever a dispute arises between a member and an employer, the syndics are to investigate the circumstances, and if they are able to arrive at the conclusion that his claim is well founded they are empowered to undertake the cause of the member. If the case has to go before the Tribunal of Commerce, which is a sort of court of appeal from the *Prud'hommes*, the chamber is to advance the sums requisite to pay the legal expenses, which are, however, to be proportionate to the amount of wages which may be claimed. Should the case be decided against the member, the loss of the fees is to fall upon the society. Besides the aid given in a law suit on a small scale, a sum of 40 frs. is available whenever a member suffers the loss of his tools in a fire, but on the understanding that it has to be repaid by instalments of not less than 5 frs. a month.

All complaints, claims, demands for inquiry, &c., are to be lodged in writing at the lodge of the society. They will receive attention according to the importance assigned to them by a council appointed for the purpose by the general assembly. Whenever it is considered necessary the council

may delegate two of its members to investigate the claims. The council can refuse support in any case which appears to be inequitable, or whenever the member is in fault. When the council has resolved to support the claim of a member he will receive an indemnity for the time he spends in pursuing his case which will only correspond with the wages recognised by the *Prud'hommes*, or, in other words, there is no inducement to be litigious. To gain these benefits it is necessary for a carpenter to be a member during a period of six months at least, and to have paid his subscriptions regularly. A workman who has been a member of a provincial society for that period, before joining the Paris society, is also entitled to support from the time of his admission.

Should a member fail to pay his subscription for three months in succession, and if the neglect is supposed to be culpable, he is to be considered as no longer a member of the society unless he completes his subscription before a resolution is taken. If he desires to be readmitted it will be necessary for him to pay the 3 frs. which are due, and a period of six months from his readmission must elapse before he is again in a position to demand the benefits of the society. Should a member leave Paris, he has to inform the council of his intention, in order that if, at any future time, he should return, he may not have to pay the admission fees, or wait the end of the six months' term. A member returning from military service is readmitted without paying the 3 frs. for arrears or 75 c. admission fee, provided that he had informed the council of his departure for the army, and inscribes his name within three months of his return to civil life.

The meetings of the council are held on Tuesday evenings from 8.30 p.m. to 10.30 p.m., and resolutions are not recognised unless more than one-half the members had been present when they were passed. In cases of urgency the secretary can convoke extraordinary meetings. The society is protected against usurpation of authority by the officers. The council is to account for its actions to the society by submitting the minutes to a general assembly. There are no sinecures. A member of council who fails to attend three successive meetings without giving sufficient reason for absence thereby forfeits his position. Members can be struck off the rolls if they break any of the statutes or bring the society into disrepute, but it is necessary that the demand for demission should be signed by at least ten members, and voted in a general assembly. The subscriptions paid by those members, as well as by members who have resigned or died, belong to the society, and cannot be made the subject of any claim.

A register containing the names and addresses of employers, which can be freely consulted by the members, is to be kept at the lodge. The meetings are to commence at the time fixed, whatever may be the number of members present. The secretary nominates the chairman for the day (who need not preside at two consecutive meetings), and the two assessors; the three are to be taken indiscriminately from among the members. The chairman is not to take a side, but only to make observations that will preserve good feeling in the discussion. The general assembly is the sovereign power of the society. It can deliberate even if it has not been attended by a majority of the enrolled members, provided that the meetings have been regular in form, and correspond with the programme indicated in the advertisement. Notices of motions and amendments are to be deposited on the table after the reading of the minutes, and they are to be read to the meeting by the chairman. A vote will then be taken as to whether the subjects require immediate discussion. The resolutions are binding on absent members. The precaution is taken in the statutes to announce that any member who presents himself in a condition that is likely to cause annoyance in the assembly will not be admitted. All the propositions which have been taken into consideration at a general assembly will be referred to the council by a committee who will be appointed for that purpose, and who will report to the following meeting. The advertisements of meetings are to be duly posted in the hall where the meeting is to take place. At the opening of the meeting some members will be nominated to act as stewards, and they will inform the chairman whenever a member desires to speak. The general meetings will be held in a central part of Paris; the five sections into which Paris is divided will meet in places most convenient. The council will be represented at the sectional meetings by a secretary having charge of the minutes, who will uphold, as far as possible, the propositions adopted by the council, a receiver

for the section, a receiver of entrance fees, and one of the members of the committee of control. The resolutions of sectional meetings are not authoritative until they are ratified in a general assembly, unless in a case where similar resolutions had been adopted in the five sections.

An office-bearer gains little but honour by his position, since all the functions of the syndical chamber are to be discharged without payment. When one of the members is employed in the service of the society during the ordinary hours of labour, he is to receive an indemnity that is equivalent to the normal rate of wages, with an addition of 10 per cent. per hour for the inconvenience of leaving work. As he is so often liable to be called away on official business, a member of council is not likely to be made a superintendent by a contractor. The funds of the society—that is, admission fees and monthly subscriptions—are, as we have seen, to be employed in vindicating the recognised rights of the members, afterwards in establishing drawing schools, a technical school for apprentices, and a library which is to be reserved specially for carpenters, in defraying the general expenses of the syndical chamber, and in giving aid towards the setting up of syndical workshops. There are some members who believe that the last named is the most important application. When the money in the chest exceeds 500 frs., the surplus is to be invested by the council acting on the advice of a general assembly.

The founders of the society have no faith in their own infallibility, for it is a principle that the statutes are always open to amendment. A proposal for a modification of them is to be signed by at least fifteen members, who have belonged to the society for six months. It will be submitted to the consideration of a committee, and afterwards discussed at the meeting which follows the presentation of their report. The members are understood from the time of election to have undertaken to aid in the progress and development of the society by punctual payment of the subscriptions and by propagandism in its behalf among their friends. The carrying out of the statutes is confided to all the members individually, and they can all do something to promote the success of the association.

In case of the death of one of the members a deputation of ten members belonging to his section will be convoked by the receiver in order to assist at the obsequies—that is, if the family have given timely notice. The council is to be represented by a member at every burial. If a member who has been summoned does not assist at the burial, he will have to pay a fine of 5 frs., unless he can satisfactorily prove that he was ill or out of Paris at the time. A wreath of the value of 10 frs. will be placed on the coffin, with the inscription "*Chambre Syndicale des Menuisiers*."

## THE INTERNATIONAL HEALTH EXHIBITION.

IT is gratifying to find that the Health Exhibition is becoming more attractive. With the exception of the Chinese court, it may be said to be complete. The Prince of Wales inaugurated the work of the juries on Tuesday, and it may therefore be assumed that the exhibits are in their places. We continue our observations on the objects which are likely to have most interest for our readers.

*Messrs. James Stiff & Sons.*

Stands 213, 476, and 807 are occupied by Messrs. JAMES STIFF & SONS, the London Potteries, Lambeth. The pottery-ware turned out at these works is of such variety that it enters into three different classes, which accounts for their occupying the above stands, which are situated respectively in the south gallery, the south annexe, and the east central gallery. In the first-mentioned position the exhibit is confined to jars and such like utensils for domestic use, jars, bottles, and containers for wines, spirits, or beer, and an extensive assortment of ware for laboratory purposes, including distilling apparatus, cells for electric batteries, &c., all of which give evidence of fine quality of material and first-rate workmanship. At their Stand No. 476 in the south annexe they display a collection of the sanitary ware for which they are justly noted. The space here allotted the firm is somewhat cramped, but the goods, being arranged on shelves built up tier above tier, are seen to good advantage, and prove to be an excellent assortment. The exhibit comprises a variety of water-filters, kitchen, housemaids', and slop sinks, closet-pans, drain-pipes, with their connections of junctions, bends, &c., and several patent traps of the most approved patterns, including Weatherly's waste-water trap, Lovegrove's inspection pipes, Bevan's patent traps, &c., and last, but not least, the "Weaver"

trap, one of the most simple and effectual of its kind, and which has been the object of much well-merited favour. The principal features at Stand 807 are the specimens of architectural terracotta, which can scarcely be too highly commended, though the fireproof terra-cotta steps, smoke-curing chimneypots, ventilating bricks, and damp-proof courses here shown are well worth notice, and, in common with the other articles sent by this firm, form a most useful and interesting contribution to the exhibition.

*Mr. George Jennings.*

At Stands No. 522 east annexe and No. 927 east central gallery, Mr. GEORGE JENNINGS, Stangate, S.E., displays a very creditable assortment of the inventions for which he is famous. That this firm has done more than any other to perfect our sanitary arrangements, whether of a public or private character—that it has been, in fact, the pioneer in this science—scarcely needs corroboration from us; and, in making a tour of this section, one instinctively pulls up on alighting on this familiar name, and is not satisfied until a close inspection has been made of the appliances shown. The former of these stands is replete with the patent urinals and water-closets that have obtained such notoriety, and comprise the double-seated valve water-closet, in which the common evils of noise, complication of parts, and the displacement of impure air are effectually overcome; the patent valve closet and trap, in one piece of earthenware, which is also noiseless in action and so efficient as at all times to regulate the quantity of water necessary to the basin, and so render overflowing an impossibility; the patent “trapless” valve water-closets, whose salient features are due to the patent flexible-seated ball-trap; the patent improved Bramah valve closet and trap, especially adapted for Continental cities and places where the water supply is limited, as from the form of the basin only a small quantity of water is required for flushing and charging purposes.

Passing on to Mr. Jennings's stand in the east central gallery, there is to be seen a varied assortment of his other equally useful and admirable appliances, such as electrical bells, burglar alarms, lightning conductors, &c., enamelled copper baths fitted complete, improvements in valves and water fittings, kitchen, scullery, and slop sinks in enamelled slate, sinks for artisans' dwellings, improved patent lavatories, and patent tip-up and lift-out lavatory basins, patent arrangement for warming and ventilation, and minor drainage accessories, including patent traps, gullies, and other connections. Of the lavatories shown we are enabled to give an illus-

tration of one well worth attention. It is fitted with patent “tip-up” and “lift-out” basin, and other recent improvements; there is nothing to harbour dust or dirt closed in underneath, and the form enables one to sit close up to it in a convenient position for a shampoo.

Our next sketch depicts Mr. Jennings's patented improvements in the construction of sewer inverts. A glance at the drawing will

readily show wherein lies their superiority over the stoneware invert blocks hitherto used. The principal drawback to the latter has been on account of the very limited glazed surface presented to the flow of sewage, which, in the one now before us, is simply and effectually overcome by building up an invert partly of brick and partly of stoneware, and so the desideratum of a well constructed and strong base with a broad glazed surface is secured at a minimum cost, while they are capable of application to, almost

any radii, breadth of surface, &c., for the various sections engineers require.

Mr. Jennings's arrangement for warming and ventilating must not be passed over. The apparatus, as a glance at the illustration will show, consists of an upright cylinder, containing a number of

tubes, communicating with the external air by means of a passage formed through the wall. If steam or hot water be admitted to the cylinder a continuous supply of warm fresh air is drawn into the room, its velocity being determined by regulating the stop-cock C. The system has been applied to many public buildings, and the testimony received as to its efficiency is all that can be desired. It will be seen that there is much of interest in this collection, and such as will well repay a visit.

*Messrs. Cliff & Sons.*

At the head of the east central gallery we find the exhibit of Messrs. CLIFF & SONS, of Wortley, Leeds, whose collection of decorative faience made in the busy Yorkshire city is, as usual, of a most interesting character. There is a difference to be noted between the productions of this firm and those who are merely tile makers, as Messrs. Cliff's decorative material partakes of the character of bricks in substance, and so forms a portion of the walls wherever it is employed, instead of being merely tiled-laid on the main structure. The advantages obtained by this mode of treating the decorative feature must be palpable to all, for instead of a thin tile, that sooner or later gives way, we have decorative bricks that can only be destroyed with the wall itself. An example of this class of work will be seen in two large circular-headed panels representing the apple blossom, the pattern being slightly raised, and which are facsimiles of some recently erected at a house in South Audley Street. A façade, consisting of three openings for the side of a kitchen in glazed bricks of buff-brown and low-toned greens, which have a clean and pleasing appearance, is to be commended from a sanitary point. This firm have always made a speciality of finely-decorated bricks, and some of the specimens exhibited here have all the appearance of china. Amongst the designs on a single brick may be mentioned a sketch of Haddon Hall, which, as regards treatment, may vie with many paintings on canvas. There are in addition sundry other decorative examples consisting of dados and other wall coverings, a handsome mantelpiece and grate front, kerbs, &c. A new exterior decorative ware, salt-glazed, is shown, looking as hard as adamant, that can be made in any design, and is calculated to resist the action of any weather or atmosphere, and is a feature that may be used to advantage in better-class buildings. Messrs. Cliff & Sons are also well to the front in baths, and their sinks, mangers, washing-tubs (if such a term may be applied to clay ware) are excellent specimens; and we understand they are largely exported to America. They are all made in one piece, and thickly coated with a white glaze. The baths are also in one piece, of good shape, and may be coloured and decorated to any extent. One is exhibited handsomely mounted in mahogany, with faience panels, surmounted along the entire length of one side with a noble bevelled-edged looking-glass in mahogany frame. Another, unmounted, is shown in pink, with a bordering to represent tiles all worked out in the decoration. Though not so extensive in bulk as the exhibits of one or two of their competitors, Messrs. Cliff's collection loses

nothing by comparison. In the south annexe Messrs. Cliff & Sons have another stand devoted exclusively to their salt-glazed drain-pipes and other sanitary ware, of which, as is well known, they are extensive and reliable makers.

*Messrs. W. A. & S. Smee.*

At Stand 401 Messrs. W. A. & S. SMEE, of Finsbury Pavement, E.C., have fitted up a luxurious bedroom and boudoir, designed and arranged by Mr. Alfred Smee. The bedroom furniture approaches somewhat to the Chippendale, and contains a very handsome brass bedstead, a chest of drawers, with linen-cupboards above, made of walnut with rosewood facings, and the dressing-table, of the same woods, holds a bold swing glass with broad bevelled edges and drawers to the ground. On each side of the chest of drawers is a single washstand fitted for hot and cold water service, flanked above with a panelling of Sienna marble, the towel-rollers being made to slide in and out, and when not in use they are out of sight. A quaint fireplace occupies one end of the room, fitted with cabinets over the mantelpiece and a deep recess in the centre, on which ornaments, &c., may be placed. On either side of the grate a "settle" seat is fixed, comfortably upholstered, and presenting an inviting air. The walls are covered in a neutral green tint, with a cornice of walnut wood, and above that a deep frieze of a plain lemon-coloured tint. A parquet with eastern rugs and some comfortable chairs are the remaining principal embellishments. The boudoir is also a very comfortable apartment; a large "settle" seat with return end, to which curtains are affixed, is the largest piece of furniture, and the return end can be removed from it, which enables the whole or either portion to be removed to any part of the room. The woodwork of all the furniture is of an enamelled ivory tint, and consequently washable. The grate and mantelpiece are made to project into the apartment, and opposite this at the other end of the room is a pretty cabinet with canopy, to match the one over the grate. The window is arranged as a little alcove, and here again we meet with cosy "settle" seats on either side, a receptacle for flowers occupying the central portion of the window. The walls are papered in blue, comprising two colours. There is no fully defined cornice, but the spring of the ceiling may be said to form one, and is papered with a light blue pattern on white ground. The only fault we find with the general appearance is that the large "settle" has too stiff an appearance with it, and has more the appearance of a piece of furniture adapted for an invalid room than for a lady's morning reception apartment.

*Mr. Archibald Dawnay.*

At 809, the Stand of Mr. ARCHIBALD DAWNAY, King William Street, E.C., are specimens that anyone can examine with advantage, as the principles adopted by him for the construction of private or public buildings, so as to render them fireproof, cannot be too widely known. The exhibit comprises sections of rolled iron joists and girders, and sections of angles, channels, tees, &c., in a variety of sizes such as are being constantly used for his fireproof floors and roofs. A section or portion of a solid fireproof floor, also shown, gives a clear idea of the system. It consists of an encased girder, and is finished externally with McLean's patent cement tiles. In a word, the principle consists in embedding either girders, stanchions, columns, &c., in cement concrete, which renders them indestructible by fire. Among the other advantages of floors so constructed may be mentioned the following—they have no lateral thrust or expansion, and they give the maximum strength with the minimum thickness. The ceilings are quite flat and ready for plastering without laths, and finally may be inserted in place of existing wood floors. It is needless to mention how particularly suitable they are for premises where manufactures of an inflammable nature are carried on, and any who contemplate erecting buildings for such purposes would do well to give Mr. Dawnay's system a trial.

*Mr. W. H. Bateman.*

At Stand No. 828 Mr. W. H. BATEMAN, 90 Cannon Street, E.C., is exhibiting Sir W. Burnett's patents for the preservation of timber, canvas, cordage, &c., from dry rot, mildew, or premature decay, and likewise for rendering wood unflammable. There is nothing new in these various processes, they having been shown and awarded a prize medal in 1851; but, nevertheless, a few words as to some of their advantages will not be out of place. The fluid hardens and improves the texture of wood, and enters into such permanent chemical combination with the fibre that no amount of washing or boiling in water will remove the chemical compound so formed. It also prevents the adherence of animal and vegetable parasites, and the attacks in India of white ants and other insects. It renders the wood, as we have already remarked, perfectly unflammable, and so makes it very suitable for applying to the planking of railway bridges, sheds, &c. The timber can be prepared at all times, whether wet or dry, green or seasoned, with the certainty of the preservative fluid penetrating to the centre. Applied to canvas, cordage, &c., it renders them more pliable without discolouring them, and, as is the case with wood, washing or boiling in water will not destroy the chemical combination that has taken place with the fibres. Other solutions, such as Baker's

tinning and soldering preparation, and a highly concentrated disinfecting fluid that is quite colourless, and will not stain the most delicate fabrics, are also exhibited at this stand, and are well worth attention.

*Mr. G. H. Thompson.*

In the eastern gallery, amongst the stoves and grates in action, will be found the patent open smokeless grates and kitchen ranges, the invention of Mr. THOMPSON, of Marquess Road, Canonbury. Although not connected with this industry, Mr. Thompson is engaged in an occupation in which large quantities of fuel are daily burnt, and his attention has for a long time been devoted to the economisation of fuel and the consumption of smoke. At the Smoke Abatement Exhibition of 1881-82 he exhibited an open grate; but his ideas were not then so perfected as they are now, and the grates shown here are the results of his experiments made in the interim. There is novelty in their constructive parts and simplicity in the working arrangements, and we have not the slightest doubt that the invention will receive careful consideration at the hands of the jurors when making their examinations. The prevention of smoke in open grates is a problem very difficult to solve, and it is a well-grounded opinion that it can never be entirely eliminated so long as we persist in using open fireplaces. That it can be materially reduced, however, and to a mere minimum, Mr. Thompson conclusively shows us, while retaining all the gratification the Englishman derives from a bright open fire. Mr. Thompson acts upon the assumption of the late Dr. Siemens and others, that coal should never be used in its raw state, that to do so is wasteful, extravagant, and injurious to health and our surroundings. Attempts have been made by other inventors to carry out this idea, but for domestic fireplaces we have not seen anything so effective as the plan here adopted, and two of the advantages are that it does not increase the size of the grate or add to its cost, as an ordinary register can be sold at a trifle over that of the commonest made. We subjoin illustrations of the grate in section and elevation, and it will be seen by the latter how little it differs in appearance from the ordinary kinds. The solid plate at the back represents the cover of a chamber forming a portion of the fire-basket, which communicates at the bottom with the front part in which the fire burns. To feed the fire this lid is lifted forward, and the coal is placed in it. Here it is coked, so to speak, before being introduced into the burning mass, and the gases or hydro-carbons have to pass downwards into the ashpit, where they mix with the heated oxygen, and pass upwards through the fire, the access to the chimney being the usual one directly over the fire. This coking-box may be fairly termed a combustion chamber,

and the admission of the prepared fuel to the fire is effected in an ingenious automatic manner. The receptacle on which the coal is placed is a grating poised in the centre and weighted at its lower end; consequently, if ever empty, the weight causes it to assume an almost perpendicular form; but as this is never the case when a fire is in the grate, there is always room to put in fresh fuel; but the action of the weight being always to fall, it is constantly exerting this influence upon the coal which it imperceptibly forces forward into the fire. Robbed by this time of all its deleterious compounds, it enters upon its functions in the fire as what may be termed a semi-coke form, and the result is always a clear bright fire devoid of smoke. If the visitor will walk outside into the open air and look up at Mr. Thompson's smoke-pipes he will never see anything worse than a thin light vapour being given off, excepting when the lid of the coking-chamber is opened to show the arrangements to visitors, when perhaps a little smoke may be seen to pass out. The security from smoke thus rests with the fuel always being put in its proper receptacle, and as this is little or no more trouble than throwing it direct on the top of the fire, we can imagine nothing more absurd than a person adopting these grates and then treating them in such a manner. Presuming that a careless servant, in the absence of her mistress or master, was to feed the fire in the ordinary way, the result would be detected immediately on their return to the room. Mr. Thompson treats open and close fire kitchen ranges in the same way, and this should prove a boon to the cook that she will not be slow to avail herself of, for it will always give her a clear bright fire instead of (often-

times) a smoky one, that sours her temper and gives her unnecessary trouble. Making due allowance for any objections that sceptics may raise, we consider that Mr. Thompson has done a great deal towards solving a difficult problem.

*Mr. J. Ebner.*

At Stand 866, Mr. J. Ebner, 51 Clerkenwell Road, E.C., contributes a very unique collection of mosaic decorations suitable for cathedrals and churches, plainer or simpler examples of mosaic work for floors of ordinary buildings, and some very elegant designs in parqueterie. Though it is almost impossible to select distinctive features in speaking of the above kinds of work, to call the attention of the reader to, we have no hesitation in saying that the whole of the specimens here shown, both as regards the mosaic and the parquet work, represent very considerable artistic feeling, and are of the first order of merit, while the workmanship and finish leave nothing to be desired. Some slabs of "marble concrete" are also shown in various combinations of colours, which are almost equal in appearance to regularly-laid mosaic work, but the price is very much lower.

*Mr. G. Edwards.*

Stand 398 is occupied by Mr. GEORGE EDWARDS, 68 Brompton Road, who shows his patent fittings for opening, closing, and fastening window-sashes, especially those of a heavy description. They have been some years before the public, but we believe there is nothing at present that excels them for their particular purpose.

*Mr. J. D. Tucker.*

At Stand 397 is to be seen another spécialité in window sashes and frames manufactured by Mr. J. D. TUCKER, Bromley, Kent. They have the appellation of "water-tight," and it is claimed for them that they effectually exclude all draughts, dust, wet, &c., and when their construction is closely looked into, there is little doubt but what they will do so. Indiarubber cushions are fixed in the top, bottom, and meeting rails of the sashes, which fit into hollows or grooves sunk in the window head and sills; the meeting rails are similarly fitted. The runners or parting beads are screwed to the pulley stiles, and so constructed as to fit into the sashes, and thus making the window, to all intents and purposes, air-tight. Mr. Tucker supplies these sashes and frames in all sizes and shapes, and in various woods; and first-class buildings, would be much improved if they were more generally fitted with them.

*Mr. W. J. Penny.*

At No. 396 Mr. W. J. PENNY, of 11 Sidmouth Street, Gray's Inn Road, shows his double-action window sash and frame, which possesses unique and important features. The remark that has been made of some of the exhibits, that it requires a considerable stretch of the imagination to see their connection even in the remotest and most indirect way with health, cannot in the least degree be said of this invention, for it provides a simple and easy remedy for the prevention of injurious accidents and loss of life of a by no means uncommon source. The object of the patent is to enable both sides of ordinary vertical sashes to be cleaned from the inside of the room, or to facilitate their removal for the purpose of admitting large articles of furniture. The *modus operandi*, which we believe is the simplest in the market, is as follows:—The bead on one side is hinged and kept in its proper position by one thumb-screw; when it is required to remove the lower sash, this bead is turned back, and the sash opens into the room with a wicket motion; the bead that divides the two sashes is likewise hinged, and the upper sash opens into the room in the same manner. It will thus be seen to possess very important advantages, and, if builders were compelled to use this patent for all windows above the ground floor, many lives would be annually saved.

### LOCAL SURVEYORS.

THE following examination papers were given to the candidates at the examination of local surveyors, held at the Sanitary Institute on the 5th inst. :—

What public laws exist as to the construction of new houses and buildings in respect of height, thickness of walls, general curtilage, and outbuildings?

What legal powers can a local surveyor use to compel the laying on of a proper supply of water? In the event of his reporting to his authority that entry for this purpose has been refused, how would he substantiate his report before the magistrate?

Describe the powers exercisable by the surveyor of a local authority with respect to ventilation of—(a) Buildings, dwelling-houses, and manufactories; (b) Sewers, private and public. What provisions ought to exist to carry out ventilation in each of these?

How would you calculate the dimensions of an outfall sewer for a population of 15,000 people, the ground affording a gradient of 1 in 600?

Under what circumstances would you adopt a glazed earthenware pipe sewer in preference to one of brick? How would you

form a brick sewer in a running quicksand at a depth of, say, 12 feet?

Sketch a ventilating chamber and a man-hole, and also a means of flushing a pipe sewer.

Supposing that a new water supply is needed for your district, how would you ascertain the sufficiency or otherwise of any adjacent brook or river to supply the necessary quantity?

What is meant by hard water? What sources usually furnish it? and what is meant by total hardness and by permanent hardness?

What are the most common causes of pollution of water in wells, in water-butts, and in cisterns inside houses? and what steps would you take to prevent pollution in each case?

What amount of fresh air must be supplied per hour for each individual for health? To what extent and in what manner does the quantity depend on the size of the room in relation to the number of occupants? Explain by one example how your result is arrived at.

Draw up a short set of by-laws for the proper management of a common lodging-house.

Describe the manner in which you would construct a macadamised road upon newly filled up ground. Give sketches of the construction of a macadamised road, and show the form of the surface and the falls from crown to channel.

### THE FORESTRY EXHIBITION, EDINBURGH.

THE International Forestry Exhibition, which is to be opened at Edinburgh on July 1 next, gives promise of being a very successful affair. For its inception credit is due to the Scottish Arboricultural Society, whose president and office-bearers have pushed it forward in a most hearty manner; though the exhibition arrangements have since been worked out by a committee upon which the Highland and Agricultural Society and one or two other public bodies are represented. A forestry exhibition, says the *Scotsman*, is altogether a novelty in this country, and it remains to be seen whether out of woodland products as pleasing and popular a show can be organised as was done two years ago in connection with sea and river fisheries. The Forestry Committee, however, can congratulate themselves so far that their scheme of exhibition has commended itself most unmistakably not only in this but in foreign countries, so that literally from "China to Peru" exhibits are now on their way to Edinburgh, or have already arrived, many of which are said to be of a very interesting description. For the housing of the exhibition a spacious, and in many respects handsome, wooden building has been erected, from plans by Mr. Morham, city architect, in the park in front of Donaldson's Hospital, at the west end of the city. The building is all but completed, and appears in every way to be well adapted to the purposes for which it is intended. The main building consists of a long avenue or nave, 630 feet in length by 50 feet in width, which is intersected near each end and in the centre by transepts of the same width. On the south side the depth of each of the transepts is 74 feet, and on the north side 64 feet—the latter being raised above the central hall by several steps. Over the intersection of the central transept with the main building is a lofty dome, surmounted by a flagstaff; while at the corresponding intersection of each of the end transepts there is an octagonal pavilion roof. In the interior, the roof of the rest of the building has been broken up by the introduction of circular ribbed couples, which are being painted light blue, with good effect. The building is lighted by means of lying lights along the upper half of the roof, and windows in the gables of the nave and transepts; while for ventilation, openings are left along the ridge. In consequence of the recent large demand for space on the part of the Japanese Government, it has been found necessary to erect three large annexes, which open off the north transepts. The central annexe is 200 feet long, while those at each end are 150 feet. All are 31 feet in width, and finished in the same manner as the main building. Where not of glass, the outside of the roof of the building has been covered with Gray's patent felt. The entrance to the exhibition will be by the westmost gate of Donaldson's Hospital, a short distance within which has been erected a handsome Swiss porch, with triple arcading, projecting roof, and other ornamental features. This opens into a covered corridor, 25 feet in width, which follows the line of the present carriage-way for about 160 feet, then turns off at right angles, and by two short flights of steps gives admission to the exhibition buildings. The space between the porch and the gate is to be paved with granolithic slabs; three long steps of the same material lead up to the porch, the landing of which is laid with new granolithic coloured tiles—the granolithic work being performed gratuitously by Messrs. Stuart & Co., Edinburgh, the patentees. Opening off the corridor will be postal and telegraphic offices, left luggage rooms, railway and police offices, &c.; while on each side of the landing of the stair leading from the corridor to the main building is respectively a reception room and a jurors' room, the former of which is being elegantly fitted up by Messrs. Cranston & Elliot free of charge. The stalls—10 feet wide—in nave and transept will be arranged along the walls, and there will be a central table 7 feet 6 inches in width, on which

goods will also be exhibited. Two wide passages will be left as a promenade for visitors. It may be said that the south central transept has been allotted to the Indian Government for their exhibits, and that already part of the collection has arrived, though it has not yet been unpacked. Under the central dome a fountain is in course of erection, the lower basin of which is outlined with eight semicircles. Several figures will support a small central basin, into which water will play. Around the margin of the fountain groups of plants will be disposed. In the evening the exhibition will be lighted by means of electricity, the arc light being the system employed. Electric lamps will be hung on lofty poles outside for the lighting up of the grounds. In rear of the main building are two refreshment rooms—each nearly 100 feet in length by 20 feet in width—alongside of which are two fireproof kitchens, built of brick with corrugated iron roofs. All the cooking will be done by means of gas, so as to minimise risk from fire. There are abundant means of exit from the buildings to the grounds, there being a door in the gable in each of the south transepts and two doors in each of the annexes; and the water and sanitary arrangements have also been well attended to. The cost of the exhibition buildings will be over 5,000*l*. On the west side of Donaldson's Hospital grounds is a park of seven or eight acres, which has been leased for exhibition purposes and laid out in plots of various sizes with broad, well-made walks between. Part of this ground will be allotted to nurserymen and others for the display of specimen trees; horticultural builders with greenhouses and conservatories will occupy another portion; while dotted about will be several buildings of an interesting nature, including a model of the Queen's Highland chalet, and pretty cottages from Switzerland, California, Canada, and other foreign parts. Along the east side of this park will be a range of sheds for the electric light dynamos and engines; on the north side a covered building in which machinery for preparing wood will be shown in motion; and on the west, stores for empty packing cases. On the side next the exhibition, and just off the main corridor, a house with a pretty Swiss front has been erected for the accommodation of the executive committee, the secretary, and other officials; and in the centre of the grounds there is a refreshment room. Possibly, also, a band-stand may be put up. One of the attractions of the exhibition will be an electrical railway, which is to be laid down on the north side of the exhibition buildings. Its length will be about 700 feet, and frequent trips in the cars will be daily made during the time the exhibition is open. Other novelties are spoken of for the outside, which will add to the attractiveness of the exhibition as a summer promenade for visitors. The whole of the buildings, it should be said, have been erected in a very substantial and expeditious manner by Messrs. W. Beattie & Son, Fountainbridge.

## THE ABBEYS OF JEDBURGH AND KELSO.

ON Saturday last the members of the Edinburgh Architectural Association joined in their annual excursion, when Jedburgh Abbey, Kelso Abbey, and Floors Castle were visited, under the guidance of Mr. John M'Lachlan, architect. At Jedburgh Abbey the historical and architectural points of interest connected with the fine old building were described. The site is a richly-wooded terrace on the banks of the Jed, and is one of the most attractive in the district. Jedburgh Abbey, said Mr. M'Lachlan, was founded and endowed by David I. in 1118 for Augustine friars from a large establishment in France. It was not till the close of the century that the prior of Jedburgh received the title of abbot—in the year 1174. Probably the most notable historical event connected with Jedburgh was the marriage of the ill-starred King Alexander III., in 1285, within its walls, with Ioland, daughter of the Count of Dreux. Jedburgh, like the other religious houses on the Borders, suffered severely during the unsettled times of the War of Independence. Notwithstanding all vicissitudes, however, the brotherhood waxed rich and powerful, had dependencies in various parts of Scotland, and acquired large parts of land throughout Tweeddale. There was nothing very remarkable in the history of the abbey from the War of Independence down to Lord Hertford's invasion in the reign of Queen Mary. In the month of June 1545 the abbey was attacked by the English, and, as there were none but burghers and ecclesiastics to defend it, the place capitulated, and the abbey was pillaged. The building seemed never to have been restored after the ruin thus brought upon it. From an architectural point of view, Jedburgh Abbey was interesting from its mixed character. The length of the nave is 130 feet, and the height from the floor to the wall head 50 feet. The style of the architecture is transition from Norman to first Pointed, and, though many of the features are truly Norman, such grace and lightness are exhibited in every part as are seldom seen in buildings even of two centuries later. The flowered capitals, by which the Norman forms are made to assume all the airiness and richness of the more decorated periods, are perhaps better developed in the ruins of Jedburgh than at either Kelso or Coldringham, where the same characteristics occur. To show the proportions of the nave, the whole of the moulded base

of the north aisle wall has been restored, as also a considerable portion of the south aisle wall. There has been inserted in the latter a facsimile of the beautiful cloister doorway, which, during recent years, has become very much decayed. This doorway has long been looked upon as unique, and the late Sir Gilbert Scott, alluding to this and the great western doorway, said they "are two of the most exquisite gems of architectural art in this island." The new doorway was erected in accordance with drawings by Dr. Rowand Anderson, of Edinburgh, under whose directions all the recent alterations on the abbey have been carried out. The style of this doorway, like that of the nave, is late Norman, or Norman transition, of which it is a very remarkable example. The north transept, the only one remaining entire, is of the Gothic architecture of the fifteenth century. Above the great north window are the arms of the Kerrs, the bailies of the abbey, whose burial-place is in this part of the church. The south, or cloister, doorway, between the central tower and Lord Campbell's vault, is a fine specimen of Norman transition character, and belongs to about the end of the twelfth century. The lower part of the choir is also Norman, like the transept, but the eastern extremity or chancel is entirely destroyed. The tower, 30 feet square and 120 feet high, rises upon four circular arches, and it may be ascended by a narrow stair in the south-east corner. The two piers of the tower towards the north are Norman in style, and belong to the early part of the twelfth century; while the south piers and the greater portion of the tower were built in the latter part of the fifteenth century.

The history of Kelso Abbey, Mr. M'Lachlan pointed out, is similar in many respects to that of Jedburgh. It was founded by the same monarch, had a similarly disturbed history, and was unroofed and rendered useless for occupation about the same time as Jedburgh. It cannot, he remarked, be made too plain to the people who persist in laying the devastation and ruin which came to our ecclesiastical structures in the sixteenth century at the door of John Knox, that Knox had nothing to do with the spoiling and destruction of these buildings. Both Jedburgh and Kelso Abbeys were wrecked and destroyed by the Earl of Hertford in his raid in 1545. Kelso Abbey was founded by David I. for the order called Tironensis, a branch of the Benedictines, whose chief seat was Tiron, in Picardy. Speaking of the architectural arrangement of the building, Mr. M'Lachlan said it would be observed that it was of the form of a Latin cross, but instead of the long leg of the cross lying towards the west, and the short head of the cross being towards the east, with the altar there, the arrangement was entirely reversed, and the long end of the cross, or what was usually the nave, was towards the east, and the short end, or altar end, was to the west. This was such an unusual arrangement that one was driven to look into the matter for an explanation. To ancient church builders a prime consideration was that the altar end should be to the east. Here apparently, if the short head of the cross was to be taken as a guide, it was towards the west. Might it not be that the relative length of the legs of the cross had been reversed for good and sufficient reasons? The chancel or choir of the church was occupied by the servants or priests of the body in whose honour the church was built, and the nave or west end was for the use of the congregation. Might it not be that in this case, at Kelso, the clerical brethren were much more numerous than the lay element, and required more accommodation? This seemed natural in view of the semi-secular nature of the Benedictine brotherhood. If the population of the locality 400 years ago were primarily clerical—with a dash of the agricultural, artist, and man of business in their training—they would all go into the choir, or privileged part of the church, and that part would require to be the most commodious. Hence, possibly, the large chancel end of this building. The period of the architecture as evinced by its character, the mixture of the round and pointed, was here so close that while the great supporting arches of the tower were pointed—probably from its being held to be the stronger form—the upper tiers of small windows retain the round Norman shape. The porch has often been adduced as a striking example of the capabilities of Norman architecture. Two distinct types of treatment are noticeable throughout the building—the one heavy, massive, dignified, and round, the other foliated, light moulded, and graceful. Two more complete and beautiful examples of the interesting period of transition from the massive and strong Norman to the graceful Early English than the two edifices, Jedburgh and Kelso Abbey, it would be impossible for architects to see.

On the motion of Mr. M'Gibbon, the president, Mr. M'Lachlan was accorded a cordial vote of thanks. The party also visited Floors Castle, the princely residence of the Duke of Roxburghe. The building was originally designed by Sir John Vanbrugh, the architect of Blenheim, but it was remodelled by Playfair in 1838. The park—with its old and noble trees and its celebrated gardens—were greatly admired, and from the ridge of the terrace behind the castle the party had an opportunity of enjoying the picturesque view, which embraces the town of Kelso, the winding shining water of the Tweed, and the richly wooded lands that lie beyond. The party dined early in the evening in the Cross Keys Hotel, Kelso—Mr. M'Gibbon presiding, and Mr. M'Lachlan occupying the vice-chair.

## NOTES AND COMMENTS.

THE formation of a syndicate to provide funds for the purchase of objects from the FOUNTAINE collection is an experiment that will be watched with interest. In this case the sum to be expended was not to exceed 12,000*l.*, but hereafter at other sales a wider limit may be prescribed. It is an ingenious way of bringing pressure to bear on a Government, but the members of the syndicate would do better if they did not ask to be recouped. The Exchequer does not always abound with cash, and it is no secret that the late Earl of BEACONSFIELD, in the plenitude of his power, was unable to obtain means to purchase collections on which he had set his heart. If the sale of a great collection could be foreseen, it might be possible to make arrangements; but, speaking generally, it is always inconvenient to obtain public money for such purposes. Besides, it is not always evident that costly objects are made objects of study. Supposing the FOUNTAINE collection in its entirety had been purchased for the British Museum, what percentage would be added to the visitors? People who attend auction-rooms during the season are not often seen in public galleries.

THE syndicate, acting on the advice of Mr. A. W. FRANKS and Mr. J. C. ROBINSON, have succeeded in purchasing several examples, which will be exhibited during next week at the British Museum. One is an Urbino oval dish, measuring 26½ inches by 20½, and on which is a representation of the Israelites gathering manna. It cost 1,333*l.* 10*s.* A pair of candlesticks of Limoges enamel by PIERRE RAYMOND, were bought for 1,218*l.* For a dish that is believed to be Castel Durante ware 378*l.* was paid, and 252*l.* for an Urbino dish. A dish which is supposed to be the work of JEAN PIERICAUD the Younger was purchased for 766*l.* 10*s.*, and one by PIERRE RAYMOND for 388*l.* 10*s.* There may have been other acquisitions by the syndicate, although not so described in the auction room.

THE town of Belfast seems to advance at a rate that forms a contrast to the remainder of Ireland. Within the last quarter of a century the number of houses has increased 113 per cent., and the valuation 114 per cent. In the short period of five years the houses have increased 20 per cent. and the valuation 12 per cent., or in other words, the valuation of Belfast has increased 80,000*l.* a year, and a million and a half of money has been invested in building. The figures are remarkable, and are taken from a speech delivered by the Lord Lieutenant. It has been also ascertained that on an average only five people inhabit a house in Belfast, whereas in the other large Irish towns the average is nine. The cause of the prosperity of Belfast is attributable to many reasons. It is the centre of a manufacturing district instead of an agricultural district. The town and waterway were laid out by Sir CHARLES LANYON on lines that allowed of expansion. Lastly, the difficulties of the late Marquis of DONEGAL enabled the inhabitants to purchase their tenements, and there is a greater number of freeholds in Belfast than in Dublin.

A COLLECTION of three hundred drawings by Mr. DU MAURIER is now on view in the gallery of the Fine Art Society. They will be familiar to visitors as they have been reproduced from week to week in *Punch*. But however dexterous a wood-engraver may be, it often happens that there are touches in a drawing which he fails to translate with spirit, and especially when he is working against time. This is the case with Mr. DU MAURIER's drawings, and the visitor will find that the sketches are superior to the woodcuts. It is difficult to say whether the grace of the figures—especially of the ladies, children, and young men—or the adaptive power of the artist is the more remarkable. Mr. DU MAURIER is the first foreigner who has represented English people truthfully. GAVARNI's sketches of London life are Parisian, and although GUSTAVE DORÉ was an admirer of everything English, yet amidst all his illustrations for the big book on London it is impossible to discover one figure that is typical. There are crowds of strong and ugly people, and that is all. Mr. DU MAURIER appeared at a time when it was considered hopeless to expect a successor to JOHN LEECH. Yet he was able to convince the public in a few months that he was competent to delineate the most delicate traits of English life. Mr. DU MAURIER's art has its shortcomings; he is not so successful as Mr. KEENE in representing middle-class folks, and he has not

the pathos of LEECH, but in his own line he has produced work which will always give delight.

AN American Exhibition is to be held in London in 1886. The project is being organised by General C. B. NORTON, who has filled the office of commissioner in several exhibitions. He has received the support of influential manufacturers and producers. It is said that America has not been adequately represented in European international exhibitions, and it is expected that the proposed exhibition will do much for American trade. The American artists in Paris, who form an influential body, have promised their support to the scheme. There is to be a large building, in which white and coloured American workmen will be engaged on their respective handicrafts.

ACCORDING to the latest accounts the works at the church of Montmartre are making slow progress. The scaffolding has that indescribable appearance which marks buildings which are at a standstill. As the ground is of large area, the workmen appear fewer than they are. The crypt has been partly used for some time; the porch is complete, but the masonry is not much higher than the sills of the windows. Unless more men can be employed the present generation will hardly see the completion of the dome.

THE number of calls for fires, or supposed fires, received during the past year by the Metropolitan Fire Brigade has been 2,630. Of these 337 were false alarms, 149 proved to be only chimney alarms, and 2,144 were calls for fires, of which 184 resulted in serious damage, and 1,960 in slight damage. These figures refer only to the regular calls for fires, or supposed fires, involving the turning out of firemen, fire-engines, fire-escapes, and horses. The fires of 1883, compared with those of 1882, show an increase of 218, and an increase of 446 if compared with the average of the last ten years. The quantity of water used for extinguishing fires in the metropolis during the year has been 28,998,078 gallons, or about 130,000 tons. About 67,000 tons were taken from the river, canals, and docks, and the remainder from the street pipes.

TELEPHONES may be a necessity, but some method should be devised by which it will cease to be indispensable to affix wires to the chimneys of houses and carry lines over streets. The companies have now, however, unlimited power in that way. The Wandsworth Board of Works took an action in order to prohibit the telephone companies from crossing the streets in the district with wires. The case was tried before Mr. JUSTICE STEPHEN, and his Lordship decided that the Board possessed proprietary rights over the streets, and that the word street meant not only the surface of the roadway, but a certain depth below the surface and a certain area of air space above. Although the wires might not be a nuisance, or dangerous to persons crossing the streets, yet collectively they might form an appreciable nuisance. The judgment being in favour of the Board the Company appealed, and have succeeded. According to the Master of the Rolls the Board have no property over the street, but in the street—to the extent that is required by the public, and no more. The effect of the judgment will be that apparently other things besides wires can be put over a street so long as they do not interfere with the area of ordinary user.

THE report of Mr. VULLIAMY to the Metropolitan Board of Works refers to the massive lamp standards and guard-posts which have been erected at the entrance to Northumberland Avenue from Charing Cross. The models were prepared by Messrs. MABEY, the sculptors, from designs made under the architect's superintendence. The standards and posts, which are of Classic design, are of cast iron, and each standard rests upon a solid base of grey granite. The globe lanterns, which are constructed so as to revolve for the convenience of cleaning, are, with the cradles supporting them, of bronze. A pit has been formed in the pavement at each refuge, in which the gas-meter valves and other fittings are placed. The burners are regulated to consume 35 cubic feet of gas per hour, and to give light equal to that of 150 sperm candles, so that the three lamps at each refuge have an illuminating power equal to that of 450 sperm candles. The lamps are by far the best in design in the metropolis, the light is most brilliant, and yet the whole cost has been only 2,500*l.*

THE LEEDS INDUSTRIAL CO-OPERATIVE SOCIETY'S NEW CENTRAL STORES.

**A**MONGST working-class co-operative societies that of Leeds is the largest, numbering 20,000 members, and having an annual turn-over of half a million. The management of so vast a concern—one with over 50 branch stores in addition to the central one—necessarily requires a large staff of clerks, and considerable accommodation for the directors, members, &c. Until the provision of the premises illustrated this week, the various shops, offices, &c., in connection with the head department were scattered in different buildings. To obviate the inconveniences of this, the directors recently purchased the property next to the largest of their central shops, cleared the ground, and erected the buildings shown in our view.

The basement of these buildings is lighted almost entirely by HAYWARD BROS. & ECKSTEIN'S prism lights, which have answered their purpose so well that the cellars are literally the best illuminated part of a building that has not a dark corner in it. As a result, the furnishing, hat and cap, and part of the drapery departments are placed on this floor, the approach being by three spacious staircases. These shops occupy the whole of the front to a depth of about 46 feet, the remainder of the basement being given up to storage, heating arrangements, kitcheners, &c. A large hydraulic hoist delivers goods from the ground level to that of basement, and a miniature tramway conducts to all parts of the floor. The ground-floor provides accommodation for the drapery, grocery, bespoke, ready-made, and boot departments. The centre of this floor is pierced by a wide passage or arcade, which leads to the main staircase at the back. This is of wrought iron, with the treads of HAWKSLEY'S patent. The first floor contains the offices and strong-rooms, board-room and committee-room, and a large reading-room for the use of the members. The second floor is devoted wholly to a large public hall, and to the retiring-rooms, &c., in connection with it. In the roof on a mezzanine floor is accommodation for the caretaker, and for the working tailors, &c. The whole building is well and substantially erected, with sufficient ornament to mark it as one of a quasi-public character, and as one having some special importance as the centre of so large a society.

The architect is Mr. J. WREGHITT CONNOR, F.R.I.B.A., of Leeds. The joiners' work has been done by the Society's own men, under the superintendence of Mr. J. TEARDILL, who has also acted as clerk of works under the architect. Local contractors have carried out the rest of the work with great expedition. The whole building has been completed in nine months.

## LECTURE HALL, EAST DULWICH.

**T**HIS hall was opened about four months ago, and is the first portion of an intended new church in connection with the Church of Scotland in London. It is built of red brick, with stone mullions in the windows and dressings to the doorway. Internally the walls are lined with boarding—stained and varnished—about 5 feet high, and plastered above. The roof is open to the ridge, the principals being painted a dark red colour, with toned white plaster panels between them. In the turret is one of BOYLE'S air-pump ventilators, and the hall is warmed by one of ELSLEY'S ventilating grates. The new church is to be built adjoining the lecture hall, as indicated in the view, an excellent site fronting Goose Green.

The contractor for the works was Mr. WILLIAM SMITH, of Church Street, Camberwell; and the architect, Mr. J. M. BRYDON, 5 Cambridge Place, Regent's Park.

## ST. ANDREW'S SCHOOLS, FORT WILLIAM, N.B.

**T**HESE schools have been erected in connection with the congregation of the Episcopal Church, principally through the liberality of Mr. G. B. DAVY, of Spean Lodge. The walls are entirely of red granite, with freestone dressings. The windows are fitted with stained glass by Messrs. CLAYTON & BELL. The schools are fitted with every appliance for teaching, and are placed in centre of well laid out play-grounds and garden. The cost, including enclosures and railings, was over 5,000*l*.

The architect was Mr. ALEXANDER ROSS, of Inverness, and the contractors, Messrs. McDUGALL & McCOLL, Oban.

## ST. PETER'S CHURCH, SALESBURY, NEAR BLACKBURN.

**T**HE present church at Salesbury having become very dilapidated and almost unfit for use, it has been thought necessary to take steps for the erection of a new church. A committee was recently formed for that purpose, and designs invited for a limited competition. The design selected we illustrate this week. The building will be faced externally with local stone in broken courses hammer-dressed, and will have dressings from the same quarry, the stone from which is of a warm grey colour. Internally the walls will be lined with bricks and plastered, with dressings of boasted stonework. All the exposed woodwork, such as roofs, seats, &c., will be of pitch pine, varnished. The woodwork of porch and belfry will be of oak. The roofs will be covered with green Velineli slates, with brown-red ridging. The church will contain 400 sittings.

The illustration is from a pen-and-ink sketch made by Mr. HERBERT RAILTON, from the design of the architects, Messrs. STONES & GRADWELL, 10 Richmond Terrace, Blackburn.

## BRISBANE TOWN HALL.

**I**N this design official accommodation is provided on the ground-floor for the town-clerk, city engineer, Health Board, inspector, &c. At the extreme end of the building is placed the large hall, measuring (inclusive of the orchestra) 145 feet by 65 feet, in connection with which are suitable cloak and retiring rooms for the public and the performers. The first floor contains the council-chamber, aldermen's rooms, mayor's parlour and reception-rooms, &c., and a large banquetting room, with serving-room attached. The whole of the principal rooms on this floor are so arranged that they can be used *en suite* on the occasion of any great municipal festival. A large kitchen, larders, store-rooms, and caretaker's rooms are provided on the second or attic floor. The fronts are intended to be faced with local freestone, and the estimated cost is about 40,000*l*.

The design is the joint production of Mr. W. L. VERNON, of George Street, Sydney, N.S.W., and Westminster, and Mr. ALFRED W. CROSS, A.R.I.B.A., of Hastings and 56 Chancery Lane, London, W.C.

## OFFICIAL NOTES ON FOREIGN TRADE.

**T**HE import of pig and cast iron into Italy during 1883 has been somewhat in excess of the quantity in 1882, owing partly to the excessively-low freights running throughout the year, and partly to imports made directly from Glasgow for Government account for the use of the arsenals and manufacture of projectiles. The import of bar and angle iron has fallen off considerably, and this is partly due to the import of Westphalian iron *via* St. Gothard. It is a fact that German iron of these qualities is forcing its way into Northern Italy, and that there is a diminished import from England for the towns formerly supplied through Genoa. The German makers are also supplying Northern Italy, as far south as Alexandria, with iron for hoops, wine vats, horse shoes, &c., and also for screws; "blooms" are also coming from Westphalia, and the better qualities of iron from Nassau. The Germans have active agents and travellers, who canvass the country for orders, and not only take the lowest possible terms, but give prices delivered at the railway station, and take the trouble and uncertainty of incidental expenses off their customers' hands; whereas English firms only give prices at the works, and the buyer often finds that the incidental expenses of wharfage, dock dues, agency, &c., run up, more especially on small parcels, to sums quite beyond what he had reckoned on. It deserves to be noted that the Germans are beginning to do a trade in boiler iron, and Frankfort firms are now finding means of placing zinc of German make where formerly nothing was used but the productions of the Belgian Vieille Montague Company. In other metals German houses are successfully competing for custom, some of the late contracts for supply of manufactured copper to the Italian arsenals and workshops having been taken by people who will supply German goods, where formerly they would have dealt with England. An establishment for making white lead at Cogioletto, and one for red lead at Spezzia, have been set up. Both are to work under German patents.

German Portland cement appears to be coming into favour. The Stettin Portland Cement Manufactory has been enabled to increase its production to 32,500 tons, as against 26,500 in 1881. The wages paid amount to 240,000 marks, and in the lime-pits belonging to it 45,000 marks. The bulk of the cement was sold into the interior, and principally used for public works. But

besides this, 13,000 tons of cement were exported in 1882 to Denmark, Sweden, Russia, Austria, and North America from these works. Whilst the export to Russia diminished under the discouraging effects of the high protective tariff, a new region for sales was opened in North America. The Stern Portland Cement Manufactory is the next in importance, having turned out a total of 204,000 barrels. The works employ on the average 600 men. The Pomeranian Portland Cement Company at Quistorp produces about 208,000 barrels a year, and employs between 600 and 700 men.

Early in 1883 it became evident that the prospects entertained at the commencement of the year of advantageous sales of timber in Gothenburg, founded upon the favourable state of the stock in London, were not realised, as offers had to be accepted to begin with at 10s., and later at 15s. to 20s. below the original quotations. This unfavourable turn is believed to have been caused by diminished requirements of the English farmer and the knowledge that the supplies in the north of Sweden, which are said to have been about 50,000 standards, were considerably larger than the preceding year. To the before-mentioned disadvantages, circumstances may also have added want of activity in building in France (Paris) during the year. It is however to be hoped that the prudent arrangement by a number of the leading wood exporters in Norrland to limit their export during 1884 to three-fourths of the shipments in 1883, will improve the prices also. With regard to Gothenburg, the prices during the year may be said to have been 31s. per 240 running feet of deals, and 15s. 6d. for 2½ by 7-inch battens.

The Government offices in Serajevo are to be Renaissance in style, and will contain 200 rooms. The works will take two years to complete, and cost 35,000l. The commerce of Bosnia, however, seems more and more to be slipping out of the hands of the natives. Many merchants who were doing a good business before the Austrian occupation have ceased to trade, and live merely on the rent of their house property. House-rent in Serajevo has become exorbitantly high, and they find a better and surer return for their money in repairing old houses or building new ones, to let to Austrians and other strangers, than in mercantile transactions. This, however, cannot last. When more houses are built, and when the Government buildings in the course of construction are completed, and the numerous houses now taken for Government offices at high rents vacated in consequence, rents must fall, and, as owing to the high price both of labour and of material since the Austrian occupation building has been exceedingly expensive, it is believed that eventually house-owners will receive but little interest on their outlay.

Timber, which is the chief article of import at Lübeck, met with an indifferent sale in 1883, as buildings for industrial purposes were erected to a very small extent, and the number of houses built for private purposes was likewise small, and not sufficient to cause an extensive sale. The tariff of 1882 has been injurious to the timber trade, it is true, but certainly not to such an extent as was apprehended, and the high duty on prepared timber has caused some timber merchants of Lübeck to build saw-mills in order to get their timber prepared here. Besides some smaller mills that are already finished, a very large saw-mill is being built at present, which will be able to furnish a great quantity of prepared timber for the cabinet-maker and for building purposes. Last year the Imperial Government proposed again to raise the duty on timber, but the German Parliament would not agree to this Bill.

The concession for the construction of an aqueduct to convey drinkable water from the mainland to Venice—which was granted on January 25, 1876, to Messrs. Ritterbandt & Dalgairns, representing British capitalists—was subsequently handed over by them to the Compagnie Générale des Eaux, of Paris. The aqueduct which passes under the lagoons, the underground pipes for the distribution of the water, and the two large reservoirs in the town, were completed at the end of last year. The total expenditure incurred by the company amounts to 5,000,000 frs. The municipality is to pay the company, from the first day the waterworks are in regular operation, 100,000 frs. a year for the supply of potable water to the 120 public wells in the town, which are to remain open three hours a day. After sixty years the waterworks are to become the property of the municipality. Private families will be provided with water at the price of 60 cents. per cubic mètre (1,000 litres), and the company will also make special arrangements for the supply of large quantities of water at lower rates. The minimum quantity of water which the company will furnish is 250 litres a day. The water is to be taken from the canal Dei Moranzani.

The excavation of the new docks at La Rochelle will, it is expected, be completed at the end of this year, and the construction of the outer harbour has already made some progress, electric light being used for carrying on the works at night. As many as

1,100 men, chiefly Italians, have been employed. The sum voted by the Government for 1884 was 1,800,000 frs., and it is anticipated that a grant of 1,500,000 frs. will be included in the extraordinary budget for the continuation of the works in 1885; but it has been intimated to the Chamber of Commerce and municipality of La Rochelle that further similar supplies must not be counted on for the purpose of finishing the new harbour within the time originally fixed, namely, 1888. With the object, however, of obviating delay in the opening of the port, the State proposes to give a guarantee of 4 per cent. on a loan redeemable in fifteen years, the town finding the money to complete the works; and it is confidently expected that some such financial combination will be carried out, and the works completed within the time intended. Any suggestion for curtailing the works of the new port, as an alternative to prevent delay, is strongly deprecated, in the belief that, unless the entire plan is adhered to, its beneficial effect on trade would be seriously compromised.

The works on the deep water lateral canal to connect Nantes with St. Nazaire are being pushed forward, and the French Chambers have again voted a considerable sum of money for their prosecution: nevertheless there are still sceptics who maintain that the present generation will not see the completion of the undertaking.

The iron works at Basse Indre, near Nantes, turned out during the past year some 8,500 tons of bar and sheet iron, being a considerable increase on the output of the previous year, and in the main due to the fresh impulse given to shipbuilding in the district. They give employment to 450 hands. There has been a fair increase in the demand for agricultural machinery of local manufacture. The excellence of the workmanship causes them to be much appreciated over a large radius. English competition is, however, a serious difficulty in the way of expansion. Local hardware has been in much request, as well for the French colonies as for the neighbouring districts. There have been, moreover, large Government orders. The Anglo-French Company's lead works at Coueron have produced during last year about 10,000 tons of lead, 1,879 tons of piping, 1,017 tons of sheet-brass, 471 tons of white lead, and 375 tons of zinc.

A large barracks is being built at St. Nazaire for lodging about 450 Custom House officers and their families. The railway around the docks has been delivered over to the Western Company, who are erecting their goods station in close vicinity of the port. A row of large warehouses has been built by the Société de France et l'Algérie. A sum of 60,000 frs. has been voted for the purpose of building a lighthouse on the Charpentier rocks, at the entrance of the river Loire.

## NATIONAL HEALTH AND WORK.

AN address was delivered on Tuesday at the Health Exhibition by Sir James Paget, F.R.S., vice-chairman, at the inauguration of the work of the international juries. The subject selected was the relation between national health and work. Sir James said that the average time of sickness among males during the working years is 1'314 weeks—that is, a small fraction more than nine days each in each year, and that among females it is yet a small fraction more. The result is that among males there is a loss of 9,692,505 weeks' work in every year, and among females a loss of 10,592,761 weeks. Thus we may believe that our whole population between 15 and 65 years old do in each year 20,000,000 weeks' work less than they might do if it were not for sickness. The number is not easily grasped by the mind. It is equal to about one-fortieth part of the work done in each year by the whole population between 15 and 65 years old. Or, try to think of it in money. Rather more than half of it is lost by those whom the Registrar-General names the domestic, the agricultural, and the industrial classes. These are rather more than seven millions and a half in number, and they lose about 11,000,000 of weeks; say, for easy reckoning, at a pound a week; and here is a loss of 11,000,000l. sterling from what should be the annual wealth of the country. For the other classes, who are estimated as losing the other 9,000,000 weeks' work, it would be hard and unfair to make a guess in any known coin; for these include our great merchants, our judges and lawyers and medical men, our statesmen and chief legislators; they include our poets and writers of all kinds, musicians, painters, and philosophers. But there is a brighter side to the picture. In a remarkable paper lately read before the Statistical Society, Dr. Longstaff says:—"One of the most striking facts of the day, from the statistician's point of view, is the remarkably low death-rate that has prevailed in this country during the last eight years." In these years the annual death-rate has been less than in the previous eight years in the proportion of two deaths to every 1,000 persons living. The average number of deaths has been 50,000 less in the past than in the previous eight years. In a paper last year, at the

Statistical Society, Mr. Noel Humphreys showed "that if the English death-rate should continue at the low average of the five years 1876-80, the mean duration of male life in this country would be increased by two years, and that of female life by no less than 3·4 years, as compared with the English life table." And he showed further that "among males 70 per cent. and among females 65 per cent. of the increased life would be lived between the ages of twenty and sixty years, or during the most useful period." I should like to be able to tell the value in working power of such an addition to our lives. It is equal to an addition of more than 4 per cent. to the annual value of all the industry, mental and material, of the country. But some will say, admitting that it is desirable, seeing how keen the struggle for maintenance already is, can more than this be done? And the answer may be and must be, much more. In this, as in every case of the kind, every fruit of knowledge brings us within reach of something better. While men are exercising the knowledge they possess they may be always gaining more. This exhibition has scores of things which are better helps to rational health than those of the same kind which we had twenty years ago, and with which the gains already made were won. If I were not in near official relation with the jurors I would name some of them; there are truly splendid works among them. But do not let me seem to disparage the past in praising the present. It is difficult to speak with gratitude enough of what has been done, even though we may see now ways to the yet better. Anyone who has studied the sources of disease during the last thirty years can tell how and where it has been diminished. There is less from intemperance; less from immorality; we have better, cheaper, and more various food; far more and cheaper clothing; far more and healthier recreations. We have on the whole better houses and better drains; better water and air; and better ways of using them. The care and skill with which the sick are treated in hospitals, infirmaries, and even in private houses, are far greater than they were; the improvement and extension of nursing are more than can be described; the care which the rich bestow on the poor, whom they visit in their own homes, is every day saving health and life; and even more effectual than any of these is the work done by the medical officers of health and all the sanitary authorities now active and influential in every part of the kingdom. Good as all this work has been, we may be sure it may become better. The forces which have impelled it may still be relied on. We need not fear that charity will become cool, or philanthropy inactive, or that the hatred of evil will become indifference. Science will not cease to search for knowledge, or to make it useful when she can; we shall not see less than we do now, and here, of the good results of enterprise and rivalry, and of the sense of duty and the sorrow of shame that there should be evil in the land. What more then, it may be asked, is wanted? I answer, that which I have tried to stir—a larger and more practical recognition of the value and happiness of good national health, a wider study and practice of all the methods of promoting it, or, at least, a more ready and liberal help to those who are striving to promote it. In one sentence, we want the complete fulfilment of the design of this exhibition, with all the means towards health and knowledge that are shown in it, and with its handbooks, lectures, conferences, and the verdicts of its juries. We want more ambition to health. I should like to see a personal ambition for renown in health as keen as is that for bravery or beauty, or for success in our athletic games and field sports. I wish there were such an ambition for the most perfect national health as there is for national renown in war, or in art or commerce. And let me end soon by briefly saying what I think such health should be. I spoke of the pattern healthy man as one who can do his work vigorously wherever and whatever it may be. It is this union of strength with a comparative indifference to the external conditions of life, and a ready self-adjustment to their changes, which is a distinctive characteristic of the best health. He should not be deemed thoroughly healthy who is made better or worse, more or less fit for work, by every change of weather or of food; nor he who, in order that he may do his work is bound to exact rules of living. It is good to observe rules, and to some they are absolutely necessary, but it is better to need none but those of moderation, and, observing these, to be able and willing to live and work hard in the widest variations of food, air, clothing, and all the other sustentances of life. And this, which is a sign of the best personal health, is essential to the best national health. For in a great nation, distributed among its people there should be powers suited to the greatest possible variety of work. No form or depth of knowledge should be beyond the attainment of some among them; no art should be beyond its reach; it should be excellent in every form of work. And that its various powers may have free exercise and influence in the world it must have, besides, distributed amongst its people, abilities to live healthily wherever work must be or can be done. Herein is the essential bond between health and education; herein is one of the motives for the combination of the two, within the purpose of this one exhibition. I do not know whether health or knowledge contributes most to the prosperity of a nation; but no nation can prosper which does not equally promote both. They should be deemed twin forces, for either of them without the other has only

half the power for good that it should have. It is said, whether as fact or fable, that the pursuit of science and of all the higher learning followed on the first exercise of the humanity which spared the lives of sick and weakly children, for that these children being allowed to live, though unfit for war or self-maintenance, became thinkers and inventors. But learning is not now dependent upon invalids; minds are not the better now for having to work in feeble bodies; each nation needs for its full international influence both health and knowledge, and such various and variable health that there should be few places on earth or water in which some of its people cannot live and multiply and be prosperous. If, therefore, we or any other people are to continue ambitious for the extension of that higher mental power of which we boast, or for the success of the bold spirit of enterprise with which we seek to replenish the earth and subdue it; if we desire that the lessons of Christianity and of true civilisation should be spread over the world, we must strive for an abundance of this national health, tough, pliant, and elastic, ready and fit for any good work anywhere.

#### SOCIAL SCIENCE ASSOCIATION.

THE presidency of the Association for the ensuing year, 1884-5, has been accepted by Mr. Shaw-Lefevre. The presidents of departments have also been appointed, the following being the complete list:—International and Municipal Law, Mr. John Westlake, Q.C., LL.D.; Repression of Crime, Mr. J. S. Dugdale, Q.C., Recorder of Birmingham; Education, Mr. Oscar Browning; Health, Dr. Norman Chevers, C.I.E., F.R.C.S., Eng.; Economy and Trade, Mr. H. H. Fowler, M.P.; Art, Mr. Beresford-Hope, M.P. The preparations for the annual congress, which is to take place at Birmingham, from September 17 to 24, are being vigorously pushed forward by the different local committees, and a largely-attended and successful meeting is anticipated. It is sixteen years since the Association met, for the second time, in Birmingham, and twenty-seven years since it held, in 1857, its first meeting, which also took place in that town.

#### ARCHÆOLOGICAL DISCOVERIES IN ARABIA.

IN the month of January last Mr. Charles Doughty, an English traveller well known for his explorations in the north of Arabia in 1876 and 1877, proposed to make a present to the Department of Inscriptions and Belles-Lettres of the French Academy of his notes and impressions of inscriptions found in those regions, on condition that the Academy would undertake the prompt publication of these documents. Although similar researches were known to be in progress by a member of the Société de Géographie, M. Huber, and an eminent epigraphist, M. Euting, the Academy did not hesitate to accept the offer. "It is one of the fundamental rules of students of epigraphy not to allow any information to escape them," says M. Renan, in some interesting notes on the subject in the *Journal des Débats*. Moreover, many of the texts copied by Mr. Doughty might have been omitted by MM. Huber and Euting. The documents in question consist of—

- 1st. Two note-books, forming a total of fifty-six sheets, covered with copies of Himyarite, Saffaitic, Aramean, and Greek texts.
- 2nd. A series of twenty-five impressions of the great Nabatean inscriptions of Medain Salih (El-Hidjr, of the Coran).
- 3rd. A map and a series of drawings, rapidly but very exactly executed, of certain views in particular of the monuments of Medain Salih.

The following is M. Renan's account of the new light which Mr. Doughty's discoveries throw on Arabian history, dating from the reign of Augustus:—

Two influences exercised their sway over the north of Arabia at the commencement of the Christian era—the Yemenite influence, coming from the south, and the Nabatean kingdom, coming from Petra and Bosra. . . . It is probable that the rich populations who constructed these handsome mausoleums lived principally in tents. The resemblance of the mausoleums drawn by Mr. Doughty with the tombs of the Valley of Kedron, and other funeral monuments hewn in the rock in the neighbourhood of Jerusalem, is remarkable. We may assert that if the age of these latter monuments was still doubtful, it is so no longer. Here we have, in effect, monuments which are evidently their contemporaries, and which bear inscriptions ranging them with certitude from the time of Augustus to that of Titus. Several of the monuments of Medain Salih even bear the names of the sculptors who carved them. A curious thing about these inscriptions is that Mahomet certainly saw them, only in his time they could no longer be read. The most superficial acquaintance with their contents would have convinced him that the great caves where the inscriptions were found were funeral monuments. Now, in five or six passages in the Coran these caves are spoken of as the houses of giants, refugees of the antique race of Thamoud, who were punished by God for their crimes. Already sundry objections had been made against this view of the monuments, by Arabian writers, from the

very natural consideration that these low caves constituted unlikely abodes for a race of giants. When reading to Mr. Doughty the essentially funereal character of these texts, he could not refrain from the reflection that their interpretation would be a serious discomfiture for the Moslems. While engaged in taking stamped impressions of these texts, placed at great height about the door of the vaults, the natives inquired of the explorer, not without anxiety, "Are there people in your country capable of reading this writing?" Mr. Doughty told me that the idea of tombs, which would convict the Coran of an archæological error of the clearest kind, greatly disturbed the minds of the Arabs. He feared lest these inscriptions might be made to suffer some day for the refutation they give to a revealed book. I do not think so; apology *à outrance* of sacred texts never remains without reply. A reflection, at any rate, that suggests itself is the slight antiquity of prehistoric Arabia. The stories relating to the impregnable abodes of the Thamoudites were relegated, in the time of Mahomet, to a fabulous antiquity. Now when Mahomet lived these pretended cave-dwellings had scarcely more than five hundred years' existence; and, if his contemporaries had possessed merely an inkling of palæography, they might have divined their sense.

Mr. Doughty is about to publish a narrative of his journey.

## CONTINENTAL BUILDING TRADE SCHOOLS.

THE Royal Commission on Technical Education gave attention to the intermediate technical schools which are found in some towns abroad, and which afford a specialised instruction suitable for builders, for engineers, and for miners. Building schools are found principally in Germany and Austria, and do not exist as independent schools in either France, Belgium, or Italy. They resemble one another very closely in character and afford little actual trade teaching. Their chief object is to impart theoretical instruction adapted to the wants and requirements of superior workmen and foremen engaged in the building trades. Incidentally they serve for the education of draughtsmen, surveyors, inspectors of works, and occasionally of a lower grade of architects.

The *Building Trade School at Stuttgart* is one of the most important schools of this kind in Germany. The building is a magnificent modern structure, designed by Professor Egle, who is also president of the school. The cost of the building was above 50,000*l.*, and the annual budget for 1880-81 amounted to 7,378*l.*, of which 973*l.* was contributed by the payments of the pupils, the remaining sum of 6,405*l.* being paid by the State. The school is divided into two mathematical preparatory courses, and three special science divisions:—(1) for those engaged in the building trade; (2) for land surveyors and land agents; and (3) for mechanical engineering. There are twenty-eight masters of departments and thirteen assistants. It is important to notice that, unlike the French, Swiss, and other schools of the same kind, the higher technical education of Germany is not gratuitous. The pupils pay 36*s.* per half-year; no one is admitted under fourteen years of age, and many, having been engaged in practical work, are of mature age. The number of scholars in the winter course was 448; more than half of these belonging to the building trade; the average age being twenty-one years. The summer course was attended by 133 pupils. The course in each half year is the same. There are six courses of half a year each, and a considerable proportion of the students remain for this length of time. As many of those attending the classes are almost illiterate, preparatory courses of ordinary study are carried on together with the technical work.

The subjects taught are—mathematics, physics, general geometry and statics, freehand and ornamental drawing, geometrical drawing; building construction, consisting of lectures, drawing, and designing; surveying and mensuration, including lectures and practical field work; machine construction, including lectures, drawing, and designing; special drawing for joiners; gymnastics.

The drawing is taught as follows:—The student begins with plane geometrical drawing, and passes on through a series of graduated examples until he finally makes complete designs for public buildings, with the plans, sections, elevations, and perspective drawings. Professor Egle has a special method of teaching the projection of shadows, by means of parallel planes arranged to follow in contours of equal illumination.

The arrangement of the building is very commodious, and much care and thought have been bestowed on the questions of lighting and heating, as also on the general fittings of the school. This institution appeared in every way thoroughly adapted to workmen, and seemed a typical school for artisans. Drawing in all its applications to industry was most carefully taught, and the studies of the pupils evinced a thorough acquaintance with the subject.

This is in no sense an apprenticeship school, as no practical work of any kind is attempted. The object of the school is to supplement the instruction of those practically engaged in the various branches of the building trade. With the exception of modelling from plaster casts, the whole of the teaching is purely theoretical. Here, again, we see the importance of the principle

insisted upon in Germany of the continuation in the Fortbildungsschule of the education begun in the primary school. Only a few of the best of the pupils in these schools come to them from the Real Schulen.

The *Building Trade School at Dresden* is very similar to the above. The course consists of four consecutive winter sessions; it being understood that the pupils are occupied in their various trades during the intervening summers. On entry the pupil must be sixteen years of age, and must have passed through the elementary school. The pupils pay 30*s.* for each course. Like the other schools of its class, this is entirely a day school.

The first course consists of the general principles of architecture, architectural drawing, freehand drawing, arithmetic, geometry, projection, and German. The second course consists of the general principles of architecture, building construction in stone and wood, the laws relating to building, the elements of architectural drawing, designing, freehand drawing, mathematics, physics, perspective, and German. The third course comprises building construction, structures in stone and wood, plans of buildings, history of architecture, designing, freehand drawing, mathematics, physics, mechanics, and German. The fourth course consists of building construction, including construction in iron and other metals, modes of warming, heating, and ventilating buildings, designing, freehand drawing, mechanics, perspective, surveying, levelling and plotting, and bookkeeping.

This school may serve as a type of the Saxon building schools, of which there are four principal ones. All of these schools, being under the Minister of the Interior, have an identical organisation.

The *Building Trade School of Chemnitz* forms part of the Higher Trade School which we have elsewhere described. A school of a similar character is attached to the Munich Industriell-Schule, and there is also a building trades school in connection with the Berlin Handwerker Verein.

There are two types of building trade schools in Austria, the one being called the State Trades Schools (Staatsgewerbe Schulen) and the other the Foremen's Schools (Werkmeister Schulen). The more important of the former class are those of Reichenberg, Brünn, Graz, Salzburg, Bielitz, Pilzen, Czernowitz, &c. Many of these are only winter schools, because the workmen are employed in their ordinary vocations during the summer months, but during the hard Continental winters they are unable to carry them on. Some of these are only winter building schools, whilst others embrace a wider range of instruction, and more nearly correspond with the Industrie Schulen of Bavaria, serving the purpose of training men generally for intermediate posts in industrial works.

Schools of this kind vary considerably according to the requirements of the district in which they are situated. Thus, for example, the school at Graz contains two divisions, one for those in training for, or already engaged in, any one of the different branches of the building trade; and the other an applied art division for the various trades in which art knowledge is necessary.

To this school is also attached a continuation school (Fortbildungsschule), and an evening and Sunday school for journeymen and apprentices. These evening schools continue the instruction of the primary school, with, in addition, suitable lessons in drawing adapted to the various industries, together with modelling, wood carving, &c.

All these schools have for their object either to give a special preliminary training to workmen who are about to enter various industries, or by means of winter, evening, or Sunday instruction, to supplement, by theoretical teaching, the education of those who are already engaged in trade or business as workmen or foremen.

*Building Trade Schools, Vienna.*—There are two schools of this kind in Vienna, the aim of them being to give to apprentices and young men engaged in the building trades a theoretical knowledge of all the details of their industry. These schools are open all the year round, but the summer courses are thinly attended, because the great majority of students are employed at their work during the summer, and are saving money to enable them to attend the schools when building operations are suspended in the winter. In the one of these we visited there are 150 pupils in winter and 50 in the summer. The fees amount to from 1*l.* 13*s.* 4*d.* to 2*l.* 18*s.* 4*d.* for the half year. Boys come to the school at fifteen, and usually go through a two years' course, with half a year for preparation if not sufficiently advanced.

The instruction is almost entirely theoretical, but in certain difficult operations experimental work is done by the classes. The pupils are mostly sons of builders, contractors, and small employers. The school has existed since 1868. It is situated in rather a thickly populated portion of the city, in order to be near the homes of the students. The hours are from eight to twelve in the morning, and from two to six in the afternoon. The school receives 917*l.* from Government and 83*l.* from the town.

In addition to day-school work, the rooms are used for evening and Sunday schools, and attended by from 150 to 200 pupils, who are required under their conditions of apprenticeship to come for two nights a week and on Sundays. This department of the school is largely supported by the Masters' Association.

The preparatory class contained seven boys, 14 to 15 years old,

who were studying geometry. The papers in geometry and in perspective were neatly executed. Some of the drawings in books, copied from blackboard drawings, were found to be creditably done. The freehand, outline drawings, and coloured designs of ornament were very good. In the first course were six boys, 15 to 17 years old, who spend most of their time in drawing and in studying the sciences bearing on construction. They devote twelve hours a week to perspective, geometry, and lectures, and make detail drawings of wood joints, scarfed tie beams, &c. The second course included 15 students, 17 or 18 to 25 years of age. There were some clever drawings of details of architecture and construction, but the freehand and shading was not good. The third course comprised 10 students, who were drawing from casts and making original designs, plans of buildings, finished drawings, &c., with elevations and sections. In the fourth course were two students. It must be seen that these small classes indicate a great waste of teaching power; but the visitors were informed that everything is as different as possible in the winter. Most of the students have had more or less of workshop experience before they come.

Two free studentships are offered by the Gewerbeverein.

The most advanced students make complete architectural drawings, in addition to which they calculate all the quantities of material required, prepare specifications, and work out estimates in detail, and show, as a contractor would have to do, the cost at which a building can be erected. They hand in *pro forma* "tenders," which are examined by the teacher, and the first place is given to the student who is most correct in his calculations, "planning," and "setting out," and who shows correct judgment of the price of the work to be done. Most of the students become draughtsmen, builders' foremen, clerks of works, and some become architects. There is an annual exhibition of drawings and designs, and friends are invited to see them.

A large room is filled with cabinets of building materials and models of all kinds, chiefly examples of building construction. There are roofs, arches, suspension bridges; in fact, it may be said that there is not a building difficulty which is not represented by some model, showing how it may be dealt with. There are also books of drawings, photographs, and descriptions of buildings, and information relating to architecture generally. The aim of the Vienna school is to give intelligence to builders, and this is the first and safest step towards the construction of good buildings. The professors spoke with confidence and enthusiasm of the results of the school. In considering these schools, among the points to be noted are, first, that the pupils are required to have had a fair preliminary education before entering them, or to supplement it in the school itself. Second, the instruction is mainly, if not exclusively, theoretical. Third, that throughout the entire course of instruction great attention is paid to freehand and geometrical drawing; and fourth, nearly all the students are or have been practically engaged outside the school in the work of their trade. It seems necessary that special attention should be drawn to the fact that parents not only make great sacrifices for the education of their children, but that the young men themselves work hard during the summer months to save sufficient money to pay their school fees, and to support themselves during the winter when work is slack.

### PULLMAN CITY.

THE report of Mr. Mather on technical education shows how much has been done in America in founding colleges and schools, but other institutions for the advancement of the work-people are not numerous. As at least sixty hours a week have to be devoted to labour, there is little leisure for study or recreation. There is no half-holiday on Saturdays, and during the year there are very few holidays. Libraries and reading-rooms are less available for the working classes than in England. Clubs and recreative institutions, promoted by the employers for the employed, are not prevalent. There is not much interest manifested by employers generally in the social condition of the people. This may be accounted for by the number of joint-stock companies.

The important experiment made by Mr. Pullman, the famous railway-car builder, is therefore considered to be worthy of special mention by Mr. Mather. Pullman City is situated about nine miles from Chicago. Its population consists of the men and their families employed in the extensive works recently built by the Pullman Company. There are at present about 3,000 inhabitants, but other works are in course of erection, and the population is increasing. The town is the creation of the company, and is designed by one architect. The whole scheme has been to surround the working-classes with simple forms of beauty, cleanliness, and order, and with the influences that refine and elevate the mind and character. No spirituous liquors are sold within the town. This did not prevent some drinking in the outlying districts when the people first came to take up their abode; but a marked change has taken place under the influence of other attractions within the town. There is a theatre where amateur performances are given by the people, as well as by professional players. The quality of the plays is under control of the authorities. In itself the

theatre is a beautiful specimen of decorative art, and is replete with every convenience. A handsome and well-stocked library and reading-room is open at all hours. A market-hall affords an ample supply of provisions of excellent quality, besides which there are shops for wearing apparel, &c. A beautiful church offers opportunity for every denomination to carry on public worship at various times. The houses are well built, elegant and comfortable, but the rents are very high, varying from 8s. to 40s. per week. The provision for open air games is excellent, with extensive cricket, base-ball, and football grounds, skittle alleys, &c. Boating on the small lake is well provided for. A splendid school building for the accommodation of five hundred children in the several grades is specially worthy of notice. The education is free, but provided for from the general taxation, which is included in the rents. Gas and water are supplied to every household. Large livery stables and storehouses afford their respective accommodation. The streets are laid in hard gravel and lined with shade trees. Squares and corners are occupied with flowers and shrubs. There is no provision yet for a night-school or for science teaching or drawing, but these facilities are to be supplied. The works are replete with every convenience as respects sanitary arrangements and washing-rooms for the men. The working man's life under all these conditions is approaching the ideal. With continuous employment secured, and wages maintained, there can be no doubt that this noble effort to elevate the labouring classes will be a permanent benefit. It is at present self-supporting, and the company receive in all about six per cent. for their total outlay on the town.

### AMERICAN FIRE EXTINGUISHERS.

THE report of Mr. Mather refers to an apparatus for fire extinguishing which has been adopted in America and Canada. Wrought-iron tubes, in parallel lines 10 feet apart, are fixed under the ceiling of a room in a mill, for instance. At 12 feet distances along the tubes small valves are placed, hanging downwards. The pressure of water in the pipes keeps the valve perfectly tight, so that no drops can escape, and the excellent workmanship in the joints of the piping (which is only one inch in diameter) also prevents any dropping of water. The small valve is ingeniously constructed, so that a relatively low temperature, say 130° Fahrenheit, melts a fusible metal ring placed on an exposed part of the valve. The softening of this metal by the heat of the fire causes the pressure of the water to overcome the resistance in the valve, and an aperture of one-half an inch bore is opened up by automatic action. The water is broken up by a spray-distributor which it strikes, and a copious shower of rain falls on to the floor after first striking the ceiling. Thus any fire occurring in a building causes one or other of these extinguishers to operate in a minute after it commences, and is immediately extinguished without much damage being done by water. An electric bell is also sounded when the extinguisher acts, to call attention. The insurance companies in Boston have recognised this system as so effective that they insure mills at a lower rate when furnished with such appliances (although the mill be not fireproof) than fireproof mills without these extinguishers. The Boston Manufacturers' Mutual Fire Insurance Company have issued specifications for mill-buildings, which they recommend above all other construction, showing wooden beams and floors throughout, in preference to the expensive fireproofing now so general in English mills and manufactories. This system of extinguishing is adopted in about 500 buildings, and is being rapidly extended. No new mills are built fireproof. The economy in outlay of capital is of great importance.

### Board School Competition at Darlington.

SIR,—Your paragraph in the issue of the 7th *re* this competition was short and simple. It contained four clear statements—viz., the date of the Board's meeting, the fact that the general committee's report was not adopted, that the Board selected a plan by Mr. F. Brooks, and that this gentleman's father, a member of the Board, took part in the decision.

Mr. F. Brooks, the successful competitor, writing in your last week's issue, says your paragraph is an *ex parte* statement. From cuttings sent you, you would see that your paragraph coincides in every particular with local newspaper reports—perhaps only lacking your emphasis. You will notice, moreover, that Mr. Brooks, in his lengthy remarks and heartfelt thanks for the great honour done him, carefully abstains from dealing at close quarters with the above-mentioned statements, which he is pleased to term "imperfect, and consequently misleading." Your statements must, therefore, be accepted as correct.

Exercising much generosity, he leaves the "false and base

insinuation respecting his father, and inferentially the censure upon the action of the School Board," to be dealt with as they think necessary. Your paragraph made no insinuation, base or otherwise, against his father; it mentioned a simple fact which no skilful shuffling of words can glaze over. Your paragraph did not say that Mr. Brooks, senior, was aware that it was his son's design he was voting for and supporting by speeches at general and committee meetings, for of course the designs were under motto.

The members of the Board doubtless will be duly thankful to Mr. Brooks for his Quixotic and chivalrous defence of their reputation, impugned only in his own imagination. The members of the Board are above any suspicion of Mr. Brooks's. Very artificial inferences, therefore, must only be regarded as a red herring drawn across the scent.

I am, &c.,  
SANCHO P.

#### Difficulties of Architectural Criticism.

SIR,—My attention has been called by my partner, Mr. Keates, to your notice of May 10, referring to our drawing of "Collyers, near Petersfield" (No. 1,280), in the exhibition of the Royal Academy of this year. I cannot help writing to tell you on our joint behalf that such a notice was a great surprise (and disappointment) to us from you.

To be asked by a journal of established fame to allow the drawing of one side of a house to be reproduced (1883) presumably because some merit was seen in it, and to have another side of same house flippantly called "a wild vagary," unworthy of being hung, &c., would seem somewhat inconsistent. Anyhow, if such a journal as yours treats what is allowed, we believe, by all to be at least original, in an age when dull adaptation of dead stuff seems the highest flight ever taken by architects, one cannot expect very much encouragement from the rest of the world.

Yours truly  
(for Bateman & Keates),  
ROBERT BATEMAN.

Poste Restante, Como: June 14, 1884.

P.S.—I cannot help calling your attention to your notice (immediately preceding and contrasted with that of ours) of "Two Houses at Hampstead," where your critic finds in the fact that "the house belongs to a type that is often built" a valid reason for giving it prominence!

#### Bispham Church.

SIR,—The views and notice you publish invite criticism and remark. I was familiar with the old church of All Hallows, Bispham—an ancient parish—and have often, as I passed through it, admired the fine, well-preserved Norman door. The arch of two orders is richly carved with characteristic Norman ornament, and has shafts and capitals in each door jamb.

I notice, with surprise, that in the letterpress account of this church, in your issue of Saturday last, no mention is made of this fine and interesting door—the more interesting because so very few examples of such work remain with us, and in this county of Lancaster there are hardly any.

I see with satisfaction that this ancient Norman door is rebuilt in or near its old place in the south wall of the nave; but this satisfaction is tempered and toned down by having to look at the ancient door through a tall "leggy" pointed outer arch to the porch, which in shape and feeling has nothing in common with the lovely doorway—nothing!

Indeed, before the church was pulled down, one would have thought that this gem of a doorway would have given the key to the design for the new church. I am inexpressibly grieved to see that it has, apparently, not been allowed to give the architect so much as a hint. There is not a trace of the *feeling* of any ancient architect about the new church. No "Norman," no "Transitional," no "Early English," no other ancient style. One feels that this beautiful door is surrounded by the incongruous.

The junction of the lower with the west end of nave was in the old church quaint—in the new one it is merely awkward.

I confess I feel indignant with the poor "modern" quasi-Gothic "neat" edifice which has sprung up at Bispham. Even the stone walling has had a sort of meretricious roughness imparted to it. The general effect of the church would have been far less offensive had the stone been built in the walls, exposing its natural face as it came from the quarry.

In these days of general architectural education there is no excuse for such disregard of what is due alike to architecture and the public.

I am, Sir, your obedient servant,  
A LOVER OF ANCIENT ARCHITECTURE.  
June 16, 1884.

#### Arsenical Pigments in Mural Decoration.

SIR,—In your report of a lecture on the above subject delivered by Mr. Chas. J. Wright, M.R.C.S. Eng., to the Leeds Architectural Association, the statement occurs that "the size with which the colours are mixed before printing used to be impregnated with arsenic, which was added on account of its antiseptic properties,"

and "the paste . . . may have contained arsenic (as a preservative)." The statement as to the size and the supposition as to the paste may both be correct; but we wish to draw particular attention to the fact that, in the course of a very long experience in the use of both materials, we have never known of a case in which arsenic has been mixed with either as an antiseptic or for any purpose whatever. We have met with similar assertions before, but we have invariably failed to trace them to an authentic source when we have endeavoured to obtain information as to their origin, and we shall take it as a favour if you will permit us to ask Mr. Wright to make known his authority through the medium of your valuable journal. There is another point in his lecture to which we should like to refer—namely, the passage in which it is stated, in reference to the death of a man through a green distemper wash, that "distinct traces of arsenic were found in the excretions by Professor Thorpe, F.R.S." We have followed with very close attention during the last quarter of a century the agitation against the use of arsenical colours and dyes, and it has never yet on any previous occasion received such powerful support as is afforded to it by that statement, if it can be accepted as accurate beyond the possibility of doubt. But the extreme difficulty of finding reagents for use in testing for arsenic, so pure in themselves as not to contain any trace of the poison, suggests to any one acquainted with the subject a doubt as to the origin of "traces" only; and, as a substantial corroboration of our own experience in this respect, we would invite the especial attention of any one interested in the matter to the valuable collection of results of testing copper and other materials sold as pure exhibited by our friend the Mr. Henry Carr referred to in the lecture, at his stand in the International Health Exhibition (east gallery), where arsenical and non-arsenical papers are contrasted and compared.

We are, Sir, yours faithfully,  
WM. WOOLLAMS & Co.

June 18, 1884.

#### Design for a Reredos.

SIR,—I collect published views and bind them the size of a double-page illustration, sticking side by side such views as are vertical or horizontal, as the case may be, so that two vertical views may be side by side, and two of the horizontal sort may be one above the other. Then there is a sorting process in piles of portfolios, some containing more interesting kinds of prints than others, and more worthy of a binding, but as they get put aside before there is any large accumulation, the system involves very little trouble. A little starch paste will last for weeks in a covered bottle—I might say months. Gum is not good for some of the soft kinds of paper used to print plates on.

Being an experienced paper-hanger, after the amount of joining I have practised for years, I consider I have made a very tolerable-looking reredos out of the view you have published with no letter press attached. I have cut it into three, and raised the floor of the central part 3 or 4 feet, introducing an altar cloth cut from the catalogue of an enterprising church furnisher. Above an altar there should be a space for alms dish or supposititious decoration between the mensa and any subject treatment.

The Last Supper, of all subjects, needs keeping up above valleys and lakes, or the idea of an upper chamber is distorted. It has slipped down or the surroundings have jumped up—just two to one on depressing the centre—a thing to deplore. I shall not remark on the details.

Yours,  
H. E.

#### LEGAL.

##### Ipswich County Court.—June 12.

(Before Sir F. ROXBURGH, Q.C., Judge.)

ORR V. SOUTHGATE.

ARCHITECT'S FEES.

This was an action brought by Mr. R. T. Orr, architect, Ipswich, to recover 10*l.* 13*s.* 2*d.*, balance of charge for preparing plans and specifications for eight houses erected on the Bramford Road, Ipswich.—Mr. Orr said he did some work for the defendant according to agreement, and subsequently defendant instructed witness to prepare plans for eight houses. He surveyed the site and prepared the plans and specifications. The plans were used by defendant, and he had them now in his possession. He (plaintiff) had only charged one and a half per cent. on the lowest tender for building the houses, 944*l.* The recognised charge was two and a half per cent., and half per cent. for obtaining the tender.—In cross-examination, plaintiff said he had received 5*l.* on account. Part of that sum was for advising the defendant in reference to a bad tenant. Defendant sought him in reference to this work. Defendant said the estimates were much too high, as he wanted houses to let at 3*s.* and 3*s.* 6*d.* per week. Witness left the plans, and told him the charge was three per cent. Defendant said the cost was too high, and he could not undertake the job. He did not then tell the defendant that the charge for what he had done was 3*l.* 10*s.* He received on that occasion 5*l.* He told defendant that the cost of advertising for tenders would be 10*s.*;

he did not suggest that the tender should come to his (plaintiff's) house—it was done in the usual course of business. Witness met defendant again, and the latter stated that the cost was too high. He could not undertake the work. At that time nothing was said about charge for the plans. On April 5, 1883, defendant claimed the plans, on the ground that he had paid for them, and witness let him have them. Defendant commenced the erection of the houses soon afterwards; witness did not claim to superintend the work. He had received a letter from defendant during March as follows:—"I know I paid you a small sum of money, and I would have paid you some time ago, but you refused to tell me what would satisfy you. If you like to make a fair and proper bill I will pay you."—His Honour: Then I have to decide what is a fair and proper bill?—Re-examined: I have always disputed that the 5*l.* I received included payment for the plans.—A son of the plaintiff deposed to hearing a conversation between his father and defendant, during which they agreed upon 30*s.* as the charge for some previous work. The 3*l.* 10*s.*, which, with the 30*s.*, made up the 5*l.* received, was on account for the preparation of the plans.—For the defence it was alleged that, before anything was done, plaintiff informed defendant that the cost of the plans would be from two to three guineas. When the plans were prepared and estimates drawn out, defendant said the cost was too much. Plaintiff informed the builders who tendered that the work was abandoned, and there was an end of the matter. There was no evidence that the plans prepared by plaintiff had been used.—His Honour said eight houses, costing 1,000*l.*, and letting at 3*s.* or 3*s.* 6*d.* per week, would bring in 7½ per cent. He did not think the houses could be erected much cheaper. The letter showed that defendant thought he had not fully paid for the plans.—The defendant was examined, and said the plaintiff told him when he first consulted him that the cost of the plans would be 2*l.* 2*s.*, and the specifications 1*l.* He had paid that sum. When he paid the 5*l.* he believed he had cleared everything. The eight houses he had erected had cost 840*l.* Plaintiff did not superintend the erection of the houses, nor did he make any application to be allowed to carry out what he had now alleged to be an agreement. Witness was aware that he owed something to plaintiff for receiving the tenders and advising him in reference to them. That was what he referred to in the letter he had written to plaintiff.—His Honour said it was quite clear that defendant did not pay 3*l.* 3*s.* for the plans, and that he left that open. The builder proceeded with the houses without consulting any other architect, and he had no doubt worked upon a modification of the plans prepared by the plaintiff. He thought the plaintiff's charge a fair one, and he gave judgment for the amount claimed, with costs.

#### Huddersfield County Court.—June 12.

(Before Mr. SNAGGE, Judge.)

HANSON *v.* ELAND & HOLDSWORD.

MEASUREMENT OF MASON'S WORK.

The plaintiff in the case was a builder, and he sued defendants, who are joiners, for 50*l.*, balance of an account for labour done and materials supplied. In May 1883 the plaintiff agreed to do the mason's work for the erection of eight cottages. There was no contract, but plaintiff proceeded to do the work, and based his charges upon certain bills of quantities. After the work was completed there was some dispute about the measuring, the principal dispute arising out of the charge for the openings left for the windows, which the plaintiff charged for as if they were solid work, and also for the headers and corners. As an agreement could not be arrived at, plaintiff made his own measurements and sent in his bill for the balance due to him.—Mr. Thomas Lister Patchett, architect, Halifax, who had been carefully over the work, stated that the plaintiff's measurements were correct.—One of the defendants alleged that there was a contract, and it was made upon a Sunday. He said there was an agreement that the openings were not to be charged for, as payments were to be made for the headers and corners.—His Honour gave a verdict for the amount claimed, with costs.

#### ART WORKMANSHIP.

**Stained Glass.**—The west window of Stanmore church has recently been filled with very rich stained glass. The window consists of four lights and tracery, and contains the following subjects:—Christ calleth John, Mother of Zebedee's children beseeching Christ for her sons, St. John reclines on the breast of Christ, St. John leads away the Blessed Virgin from Calvary, St. John and St. Peter finding the tomb empty, St. John and St. Peter at the gate of the temple, money is brought and laid at the feet of the Apostles; St. John in the isle of Patmos. The following inscription appears at the foot of the window:—"To the glory of God and in loving memory of Leopold John Bernays, twenty-one years rector of this parish, who died October 25, 1882, aged 61, and of Mary, his wife, who died November 18, 1882, aged 57; this window is erected by the parishioners of Stanmore and other friends." The work reflects great credit on the artists, Messrs. Heaton, Butler & Bayne, of London.

#### CHURCH BUILDING AND RESTORATION.

**North Shields.**—The Free Methodist Church, North Shields, which was designed by the late John Green, of Newcastle, and is in the Italian style of architecture, is about to undergo considerable alterations and improvements, including the introduction of an ornamental pulpit platform in place of the present pulpit, and a rearrangement of the galleries. The church is also to be newly painted and decorated throughout. The committee have engaged Mr. J. D. Lish, architect, Newcastle-upon-Tyne, to carry out the works.

**Parbold.**—The ceremony of consecrating and dedicating the fine new Roman Catholic Church of Our Lady and All Saints, at Parbold, was held on Wednesday and Thursday in the last week of May. The church is the gift of Mr. Hugh Ainscough, of Parbold, and has cost altogether the sum of 15,000*l.*, and Mr. Ainscough, in addition, has given a large plot of land for a burial ground, and also built a substantial presbytery for the pastor. The church is in the Gothic style of architecture, and surmounted by a tall steeple which can be seen for miles around. The building is entirely of local stone. Internally it has a bright, cheerful appearance which corresponds well with the beauty of the outside aspect. The roof is supported by two rows of plain, massive pillars, and the fittings are most elaborate and complete. The altar especially is a grand piece of workmanship, being constructed of marble and alabaster, and the altar window is large and ingeniously carved. The altar and reredos have been executed by Messrs. Sherratt & Ovens, of Preston. The church has been built from designs by Mr. Edmund Kirby, architect, of Liverpool, and the building operations have been carried out by the workpeople employed by Mr. Ainscough. At the present time there are sittings for 400 people, but the church is capable of accommodating 500. The bells are from the foundry of Messrs. Mears & Staenbank, of London.

**Rollesby, Norfolk.**—On the 10th inst. the parish church of Rollesby, near Great Yarmouth, was reopened after restoration by the Lord Bishop of Norwich. The works have been successfully carried out by Mr. Hubbard, of East Dereham, from the designs and under the superintendence of Mr. Arthur S. Hewitt, A.R.I.B.A., Yarmouth, and comprise new oak roofs to nave, aisles, and porch, being reproductions of the old ones, which were so decayed that their retention was impossible. The main timbers of the nave and porch are richly moulded with carved bosses at the intersections, the nave is covered with Edwards's tiles from Ruabon, the aisles and porch with lead. Stone tracery has been inserted in several windows in lieu of wood frames; the high box pews have given place to open benches of pitch pine, and under these the floor is laid with Gregory's wood blocks and encaustic tiles in the aisles. Provision has been made for Porritt's heating apparatus. A niche in the porch has been opened out exposing some delicate tracery; also two stoups, which were discovered under the whitewash, and a squint in north jamb of chancel arch. The base of the font has been restored, and a new bowl of Beer stone, supported on Purbeck marble shafts, has replaced one of brick and plaster of recent date.

#### SCHOOL BUILDINGS.

**Ryton-on-Tyne.**—The Thorp Schools, Ryton-on-Tyne, which were erected by the late Archdeacon Thorp, are about to be enlarged, and new porches and lavatories added, whilst the playgrounds are to be thoroughly drained, to render the schools more in harmony with modern sanitary requirements. Mr. J. D. Lish, Newcastle-upon-Tyne, is the architect.

**Greenside.**—The vicar and managers of the Greenside schools, feeling the need of better sanitary arrangements in these schools, and more school accommodation, have determined upon large extensions and alterations to meet these requirements, and have placed the works in the hands of Mr. J. D. Lish, architect, Newcastle-upon-Tyne, under whose superintendence they will be carried out.

**Fall of a School Building.**—On the 11th inst., a part of the school building in course of erection at Malvern Wells gave way, and a labourer was buried beneath the masonry. At the inquest, the architect, Mr. C. W. Stephens, of London, and Mr. Smart, builder, of Malvern, attributed the fall of the building to the late heavy rains, causing an overflow in a drain running under the structure and washing away some of the ground. The school is built on the hill side. The architect added that when the work was commenced in February he was given to understand by the builder that a drain crossed the angle of the site, and emptied into a tank considerably below the building site; but that the drain did not pass at all under the building. Since the building had been in progress, the builder had reported to him that there was another drainage tank, of which he had been previously unaware, five feet from the angle of the building that had fallen. The tank which had previously been seen proved to be the overflow tank, and they did not expect to find a second one. Having regard to the drain and the tank being so near the building, an excessive rainfall

would be likely to endanger the building. If he had known of the nearer tank he would have filled it up and had another tank formed lower down the hill. The drain was mentioned in the deed of conveyance, but there was nothing to show the existence of the nearer tank into which the drain flowed. The jury found that deceased met his death by the fall of a portion of the new schools, and that the fall was due to the overflow of a drain loosening the foundation. The jury expressed their regret that more care was not exercised to ascertain the position of existing drains, and strongly recommended the passing of a law making the registration of drains compulsory.

**Walton.**—The foundation-stone of the first schools to be erected by the Walton School Board has been laid. The schools will cover an area of about 3,000 square yards, and are intended to accommodate about 1,500 children, who will be divided into four nearly equal sections, namely, senior boys, senior girls, juniors mixed, and infants. The several rooms will be so arranged as to admit of their being lighted and ventilated on both sides. It is intended that the upper storey shall be utilised as a cookery school for girls. The architect is Mr. Edmund Kirby, of Union Buildings, Cook Street, Liverpool, and the contractor, Mr. Thomas Ray, of Seel Street, Liverpool.

### WORKS IN PROGRESS.

**The Corporation of Hertford** has just decided to adopt the tube well system for the waterworks of the town. There being ample water-power obtainable from the local stream, a water-wheel will be the motive force to raise the water up into the reservoir. This makes the sixth town waterworks provided with its supply by the system of Messrs. Le Grand & Sutcliffe.

**Mr. Renton Gibbs**, of Liverpool, has received instructions to fix his patent furnace at St. Mark's churchroom, Tollington Park, Holloway; and has also received instructions to fix his patent boiler for heating the national schools at Ulverston.

**Painswick, Gloucester.**—It will be remembered that the spire of this church was some months ago struck by lightning, and that in its fall it damaged the celebrated ring of twelve bells, the finest, it is said, in Gloucestershire. The bells have now been taken down and put in thorough ringing order, and rehung by Messrs. Llewellyns & James, Bristol, who also rearranged the chiming apparatus, which had been greatly damaged when the bells fell.

### SANITARY WORK.

**Glasgow Water Supply.**—It is proposed to increase the quantity of water supplied to Glasgow by extending the Loch Katrine Works. Mr. Gale, in his report to the Corporation, says:—There is no nearer point in the district than Loch Katrine from which the water can be drawn, and it is so situated that the water from the other lakes in the locality that are at a higher level can be drawn into it. A new aqueduct from Loch Katrine will, therefore, be the chief feature of the proposed extension of the waterworks. It will be on the same level, and will follow very nearly the line of the present aqueduct, at a distance of from 20 to 25 yards further into the hillside, both in the valley of the Forth, where the aqueduct is on the west side, and in that of the Blane, where it is on the east side of the valley, so that the new aqueduct will have to cross the present one; and I propose to make that crossing where the cast-iron pipes occur in the Endrick Valley. The necessity of constructing the new aqueduct further into the hillside will increase the extent of tunnelling, but for a considerable part of the length where the rock is hard this is the least expensive mode of construction that could be adopted, and in the part where the rocks are softer, it will be more permanent and enduring, and more easily made watertight, both from within and without, than where it is formed in open cutting. The supply to the city will then be raised to 75 million gallons per day from Loch Katrine. The surveys required to enable me to make a detailed estimate of the cost of these works have not yet been entered upon; but by assuming certain increases upon the actual cost of the existing works I estimate that the whole could be completed for 950,000*l.*, including land and compensations, but excluding Parliamentary, law, and engineering expenses, which will probably raise the total cost to one million sterling. These works, however, present the unusual feature that their execution can be spread over a lengthened period of time. There is no reason why the construction of the works should not be spread over twenty years, making an average outlay of 50,000*l.* each year; and, with a revenue increasing so rapidly as yours is, the whole can be done without adding in the least to the present rates.

**A Memorial** to the late Earl of Stamford and Warrington has been erected at Enville Church. It consists of a carved oak screen for the chancel, from designs by the late Sir Gilbert Scott, and of a clock for the tower of the church.

### GENERAL.

**Sir Frederick Leighton**, President of the Royal Academy, has consented, at the invitation of the Master and Court, to become one of the liverymen of the Painter Stainers' Company.

**An Art Loan Exhibition** was opened at Guildford on Monday in the County and Borough Hall. Besides objects of unusual artistic and archaeological interest, there is a choice collection of paintings and examples of ancient tapestry.

**The Exhibition of Pictures** at the Manchester City Art Gallery closes to-day (Saturday), and preparations will be made for the annual autumn exhibition of works of modern artists, to be opened in the first week in September. In selecting and hanging the works sent for exhibition the Art Gallery Committee have secured the assistance of Mr. E. J. Gregory, A.R.A.

**Mr. E. F. A. Spratt, A.R.I.B.A.**, has removed from South Square, Gray's Inn, to No. 7 Bloomsbury Square.

**Mr. J. H. Barclay, R.S.A.**, has been elected treasurer of the Royal Scottish Academy, in the room of the late Mr. Perigal.

**A Design** for a new statue of Queen Anne, in white Sicilian marble, which, by the generosity of the Corporation, will replace the effigy which has for so many years disfigured the front of St. Paul's, has been approved by the Archbishop of Canterbury, the Bishop of London, and the Lord Mayor, M.P., as trustees of the fabric of the cathedral.

**The Chadwick Museum** in Bolton, which has been erected by the munificence of the late Dr. Chadwick, has been opened. It contains a fine collection of art treasures, loan reproductions from South Kensington, and articles contributed by the leading firms of cotton-spinners in the town. Mr. Thomasson, M.P., has also furnished one room with pictures. The museum is not to be open on Sundays.

**A Stained-glass Window**, to cost 500*l.*, is to be placed in Salisbury Cathedral as a testimony of the regard felt in Wiltshire for the late Duke of Albany.

**The Curators of the Bodleian Library** have been authorised to expend 850*l.* in fitting up the philosophy and music school of the old schools as part of the library.

**Mr. Elliot Stock** has two fresh *fac-similes* in course of production—the first editions of the "Vicar of Wakefield" and of Johnson's "Rasselas." The former will be issued very shortly. A limited number of copies will be bound in wood taken from the panels of the dining-room of Dolly's chop-house—one of the haunts of Goldsmith, Garrick, and Johnson—when that tavern was recently pulled down.

**Mr. J. C. Thompson**, headmaster of the Warrington School of Art, has sent in his resignation. Mr. Thompson has been master of the school since the year 1855, a period of nearly thirty years.

**Funds** have been subscribed for the erection of a new theatre and opera house in Dundee.

**Messrs. J. L. Bacon & Co.** have obtained the contracts for heating Upton Church, Essex, and Celbridge Church, co. Dublin.

**The Old-established Firm of Hodgkinson & Clarke**, of Small Heath, Birmingham, is about to be formed into a limited company with a capital of 60,000*l.* The prospectus states that the business has been very largely extended, and additional capital is required to meet the increased demand which has arisen for the specialities which have recently been brought out at Canada Works. The new company, in addition to carrying on the patent blind business, will also manufacture and erect revolving shutters, school furniture, educational appliances, stained and painted glass, and hoisting and lifting machinery.

**A Prospectus** has just been issued of the Lancaster Park Hotel (Hydropathic) and High Harrogate Land Company. It is proposed to raise a capital of 100,000*l.* in twenty thousand shares of five pounds each. The object of the company is the purchase of Lancaster Park, High Harrogate, and to build thereon an hotel combined with a hydropathic establishment. The surplus land will be sold for building purposes. It appears from the prospectus that several similar speculations in the same neighbourhood are paying from 10 to 20 per cent., and it is confidently expected by the promoters that a similar success will attend the new venture.

**Steam Tramways for the Metropolis.**—An order for fifteen steep gradient tramway locomotives has just been placed with Messrs. Merryweather & Sons, of Greenwich, for use on the North London Tramways. This decision was arrived at by the directors in view of the satisfactory results secured in the use of steam as a motive power for tram-cars in the provinces. It is now some twelve years ago that Messrs. Merryweather & Sons constructed their first steam tramway engine for Mr. Grantham, and since that time the economy and practical value of steam on tramways have been demonstrated in all parts of the world. It may be mentioned that the engines of this firm have been selected before those of several competitors on account of their economy in working and low cost of repairs, great safety in running owing to the use of powerful brakes and efficient speed governors, entire absence of steam and smoke, &c.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JUNE 21, 1884.

# BELL'S ASBESTOS.

## BELL'S ASBESTOS FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under slates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

## BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION.

For coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent. more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of fresh, and applied again. The composition is supplied dry, and only requires to be mixed with water to the consistency required for use.

A horizontal boiler, 17 ft. 6 in. long, 15 H.P., gave the following results:—

Temperature on Plates .. .. .	186 deg.
" " Covering .. .. .	94 "

One ton of coal was saved per week, and, although the fire was raked out every evening 20 lbs. of steam were in the boiler next morning.

The following testimonial refers to this covering:—

Dear Sir.—It may interest you to know that we save exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRIMP, C.E., F.G.S.

**BELL'S ASBESTOS PAINT**, for floors, stairs, and all interior woodwork, to prevent the spread of fire. This paint is especially useful in cotton mills, and in fact in all factories and buildings exposed to risk from fire. It is quite free from poisonous ingredients, and is both easily and cheaply applied. Bell's Asbestos Paint has, on several occasions, done great service in preventing the loss of life and property. The great fire in Buchanan Street, Glasgow, in November last, produced the following testimony to the value of this material:—

Offices of the *Glasgow Herald*, the *Weekly Herald*, and the *Evening Times*.

Mr. John Bell.  
Sir.—As one of the means that helped to save our buildings extending from Buchanan Street to Mitchell Street from the recent great fire, I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the *Evening Times* case-room and other portions, gave tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of the Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces, with the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood, thrice coated with Irish Lime, at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

**BELL'S ASBESTOS SASH-LINE CORD** is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire escapes.

## BELL'S ASBESTOS.

The goods of this house are of the highest quality only, and no attempt is made to compete with other Manufacturers by the supply of inferior materials at low prices. All orders must be sent direct to the undermentioned depots, and not through agents or factors.

## BELL'S ASBESTOS AND INDIA-RUBBER WOVEN TAPE AND SHEETING.

For making every class of steam and water joint. It can be bent by hand to the form required, without puckering, and is especially useful in making joints of manhole and mudhole doors on boilers; also for large "still" joints, where boiling fat and steam have to be resisted. It is kept in stock in rolls of 100 feet, from 1-in. to 3-in. wide, and any thickness from  $\frac{1}{8}$  in. upwards. Manhole covers can be lifted many times before the renewal of the jointing material is necessary. The same material is made up into sheets about 40 in. square, and each sheet bears the trade mark, without which none is genuine. It is very necessary to guard against imitations of this useful material, and to secure themselves against being supplied with these less useful articles at my price, users are recommended to see that every 10-ft. length of the Asbestos Tape purchased by them bears the trade mark.

**BELL'S ASBESTOS CEMENT** for the backing of firebricks and furnaces. The use of this fireproof material saves the expense and annoyance occasioned by the repairs so constantly required in the firebricks and kitchen ranges of private houses. Any labourer accustomed to handle other cements can apply this.

**BELL'S ASBESTOS BOILER PRESERVATIVE.**—This useful mixture, by absorbing the free oxygen that is in the water, entirely checks pitting and corrosion. It also disintegrates incrustation so immediately as to prevent its adhering to the plates. Not only is a great economy of fuel effected by keeping boilers clean, but the risk of having the plates burned is thereby obviated. It has been computed that 1-16th inch thick of incrustation causes a waste of 15 per cent. of coal;  $\frac{1}{4}$  inch thick, 60 per cent.; and  $\frac{1}{2}$  inch, 150 per cent. Thus the Preservative avoids the great risks which are inseparable from scaled plates, lengthens the life of a boiler, and covers its own cost a hundredfold by economy of fuel. It is entirely harmless, and has no injurious action on metals. It can be put into the feed tank or boiler, as may be most convenient. Sold in drums and casks bearing the trade mark, without which none is genuine.

**BELL'S PURE ASBESTOS CLOTH**, for protection against the spread of fire. Iron curtains warp, and in the great emergency of fire will often be immovable. Asbestos cloth, being incorruptible, will remain strong and flexible for an indefinite period, and will stay the progress of a fire and the passage of smoke longer than any other known material. This cloth is also extensively used in Maignen's unequalled water filters, for which a gold medal and diploma of honour were awarded by the Special Commission appointed by Her Majesty's Government to receive the reports of the International Juries at the Fisheries Exhibition. By special arrangement with Mr. Maignen, his filters for houses, factories, and towns are supplied by this firm.

**BELL'S ASBESTOS BLOCK GAS FIRES.**—The Asbestos Block Gas Fire is formed by placing inside the ordinary grate a hollow block (burner), composed of Asbestos, and perforated. An iron sole-plate, with a single gas burner, is fixed at the bottom of the block. After being lighted a short time, both the block and asbestos fuel throw out intense heat.

**BELL'S ASBESTOS FUEL** for gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

**BELL'S SPECIAL LONDON-MADE ASBESTOS MILLBOARD**, for dry steam joints, made of the best Asbestos fibre, is well-known for its toughness and purity, and is absolutely free from the injurious ingredients frequently used to obtain an appearance of finish, regardless of the real utility of the material. Made in sheets measuring about 40 in. square, from 1-64th in. to 1 in. and  $\frac{1}{2}$  millimetre to 25 millimetres thick. Each sheet bears the Trade Mark.

# The Architect.

## CURIO-MANIA; OR, THE ROMANCE OF CURIOSITIES.

THE sale of the Fountaine collection at Messrs. CHRISTIE'S last week, although not by any means an exceptional manifestation of the enthusiasm which can be excited in an auction-room when curio-mania is in question, seems to have awakened throughout the country a little more amazement than usual at the large sums of good money which people of the highest character for culture can be persuaded to pay or to advise to be paid for articles which in the vernacular will be only called by some such name as toys.

We do not feel particularly called upon to rejoice over the big figures in question, nor, on the other hand, to exhibit any kind of distress at the contemplation of them; our object is to inquire what is the real effect of such romantic extravagance upon the great cause of national art, and whether there are any legitimate influences which bring about such phenomena. The mere sums of money do not tell the tale; they are but like the figures in an algebraical equation. For when one gentleman transfers to another the possession of a piece of interesting china in exchange for the possession of two or three thousand pounds sterling, which he transfers perhaps to another gentleman next week for a piece of interesting enamel in which he takes more delight for the moment, it seems difficult to see how any one of the three is a whit richer or poorer than the young people of the American story who "swopped" their articles of attire for a whole afternoon, and are represented so erroneously to have cleared a few dollars apiece.

If the article which is sold at so high a price—and it is useless to quote any more the hundreds and thousands of pounds to which the vases and dishes were "run up" the other day by the excited subjects of curiosity-mania and their shrewd agents—if the thing is undeniably a wonderful work of human genius in the direction of that supreme delightfulness which nature attains without an effort, and man must for ever therefore strive so hard to emulate in such small measure as he can, then it may at least encourage artistic endeavour in general when those who happen to be the possessors of large accumulations of property, and have to seek out channels for its bestowal to please the fancy, thus rival each other in the desire to be associated with success so exquisite, if only through the unsubstantial title of ownership—unsubstantial because the artist after all is the only solid owner of that which is his work. That one's own fingers may possibly in time be so blessed as to produce a princely thing of beauty, which shall be thus worshipped of mankind, is a thought, perhaps, of more genuine enjoyment than the anticipation of conquering a kingdom; and, indeed, is not a great artist a king of men? We may go further, and acknowledge that there are works of art whose possession by the nation, and at the highest of all prices—perhaps a price higher than any money value in the open market can ever represent—is the only honour that can be recognised as worthy of their merits. But how many of even the most highly-priced "objects of art" in the world can answer this description?

It is one of the most imperative duties of all artistic criticism in these days to keep continually before the public the fact that the "treasures" of the great collections of "art" are not identical with the masterpieces of artistic creation. Excellent workmanship of one order or another we may assume to be almost universal; it is not worth while to quarrel with the admiration of the artisan-hand when it is the artist-hand that is to be tested. But is it not often the case that, the more excellent the corporeal manipulation of the work may be, the more delusive will be such excellence, when that spiritual element of poetic device which constitutes its fine art is imperfectly, spuriously, or even—as it sometimes is—perniciously manifested?

We are not obliged any the more to deprecate the collection of highly-priced curiosities when we draw a distinction between them and the sovereign examples of artistic genius.

If it be only fairly understood that they are no more than they are, so be it; but the question is how far they can be expected to help to form a true national taste with reference to the art of the future. In other words, if the working leaders and guides of the art-workmen of England in these critical times are to be led to accept the mere curiosities of antique workmanship as "treasures of art," and to take the high prices they sell for in the auction-room to be a true test of their artistic merit, as an almost supernatural quality to be studied, analysed, admired, and imitated implicitly and unreservedly, then is it not our duty, in spite of "fabulous prices" declared from rostrums, impetuous congratulations of aristocratic companies, and delicate applause of kid-gloved ladies' hands, to warn the rising generation of manly English artist-workers that these may be treasures of authenticity but not of art?

It would be altogether a mistake, however, to let it be supposed that, while the curiosities stand so high in the market, the examples of true art are treated with less honour. The enormous prices paid by collectors nowadays are still but symbols in so many equations, and it is still the mere superfluity of general wealth that is the most important factor, but the same prodigious money figures certainly attach to pictures as much as to anything, and probably with a better appreciation and discrimination here of real intellectual value. It is unnecessary to add that, in the minor art world, and in the curiosity world itself, those articles of costly authenticity which are also of really exalted artistic merit, if they do not float any higher because of that consideration, certainly float equally high with the best. We may therefore contemplate the exaggeration of artistic prices at large as something which is brought about by influences worthy of being understood. But it is not that all artistic work sells well, or sells at all; many a struggling artist knows this to his great and abiding disappointment. It is not that even good artistic work is always a commercial success; there are only too many instances to the contrary. It is not that exaggerated values are meant to afford aid to the universal progress of the artistic spirit. Suppose the prices at CHRISTIE'S were to fall 50 per cent. all round, or even a good deal more. If such were actually to be the case, perhaps it would have to be accounted for by some great commercial disaster, affecting the whole country, and indeed extending probably over the whole of Europe; but let us suppose that it was due only to the preaching of some sudden RUSKIN-gospel of common sense, some reaction of the sense of duty, or some diametrical change of the romantic sentiment. May we be permitted to ask whether the consequence might not possibly be a speedy enhancement of the money value of many thousands of what are called mediocre because they are cheap, but are still admitted to be charming, productions of everyday artistic workmanship? The same wealth that now expends itself in the romance of long dead-and-gone authenticity might just as well, and surely to a better purpose, be diverted to the purchase of the living things of equally authentic genius that are born and bred in our own day and our own land. May we not say *a priori*, however true it is that the value of a thing is what it will bring, that a palpably extravagant and incoherent value in CHRISTIE'S auction-room is a palpably unwholesome value? And then the question is whether this unwholesomeness is a private or a public disease.

When an enamel vase of no great majesty fetches so many thousand pounds, let anyone who inspected the Fountaine collection last week reflect for a few moments upon how far the money would go in the Royal Academy Exhibition, or in the building of a mansion, a public gallery, a church, a monument, not one of which need cost a shilling the more because of its being designed with exceeding grace for everlasting homage; and then let him ask why all these should be disparaged and put out of countenance by this one little vase? Is it a work of that supernal intellect which makes man god-like? Or is it a thing of that infinitely dainty and delicate finesse of the wondrous human hand which is a material rival, so far as material rivalry can go, of the spiritual device that is still supreme? Or is it rather a specimen of rare authenticity only, which it is impossible to match, not owing to any deficiency of manual dexterity, but because of the technical question of historical counterfeit? Surely in these days of practical art it is a satire upon all this romance of authenticity when the collections of Europe are full of specimens well known as copies that cannot be distinguished from the originals, the copy worth nothing, the original priceless!

In forming a historical gallery, or rather museum of artistic works, great nations are well entitled to rival each other in procuring genuine examples at whatever price sane, not to say prudent, experts may find themselves obliged to pay for them; but it is not an act of Philistinism to observe that, even with this purpose in view, there is reason in the roasting of eggs, and wisdom, let us add, and true patriotism, in avoiding the profitless enrichment of the unscrupulous fraternity of commission agents and brokers, whose well-known ignorance of true art, if there were no other test, ought to warn off those who desire to be well advised.

Far be it from anyone to discourage the collection of works of genius; but we cannot but feel that we represent a strong feeling in this country, when we say that they ought to be really works of genius paramount, if their acquisition for universal study is to benefit the national taste in these busy and thoughtful days.

### LIFE IN ARCHITECTURE.

MOST people who are interested either in the art or the archæology of London have probably examined before now the recently uncovered side of Westminster Hall. There is nothing very remarkable about its proportions or its details, and such beauty as it may once have possessed has long ago been destroyed by excrescences and alterations. "Interesting chiefly to the historian and the antiquary" is the verdict which the modern architect, mainly intent on what will help him with his own work, will at first, perhaps, be inclined to pronounce on it. Still, it is worth a second glance, and if the eye wanders on to the modern building which adjoins it, it is pretty sure of a third one. For here, side by side, stand one of the roughest of ancient remains, and one of the most elaborate of modern productions, both alike Gothic; and yet one full of life and the other of lifelessness. In front there is an unadorned old wall, with little to relieve it except vast, unstudied-looking buttresses: further south there is the richest façade of the Houses of Parliament, with scarcely a plain stone about it; and yet, for one of the very highest qualities of art, it is the rugged building that bears away the palm, and the laboured one that cannot for a moment attempt to claim it. It is not Sir CHARLES BARRY'S design alone which shows to this disadvantage: this is the common contrast between old work and new.

Everybody with the capacity for appreciating art knows what is meant by "life" in painting and sculpture, in poetry and the drama. Every architect knows, or should know, what is meant by it in decoration, even of the less ambitious kinds. Some five-and-twenty years ago, as most of us remember, there was a strenuous attempt to supersede the so-called "conventional" ornament, found in most Mediæval work except that of the early part of the fourteenth century, by so-called "naturalistic" carving, in which the forms, chiefly vegetable, were directly copied from those of natural objects. The Oxford University Museum was one of the buildings to which this system was most thoroughly applied. Every column was finished with a representation of some particular plant, and the "fern capital," the "aloe capital," and the "violet capital" received great applause, for the moment, as new and admirable works of art. As most people now see, they were not works of art at all, but feeble transcripts of nature—imperfect even as transcripts, because they aimed at rendering, in coarse stone, effects that could hardly have been copied even in the most delicate metal-work. But it was not the imperfection of the rendering that made them intolerable so much as the lifelessness. In their anxiety to show every leaflet on the fern and every spine upon the aloe, the carvers missed the main facts about the way in which ferns and aloes grow. Their carvings, even if accurate, would only have been carvings of limp and flaccid leaves—of things which everyone would wish put out of sight if he actually saw them, and of which no one, therefore, could be expected greatly to enjoy a mere mechanical representation. Decoration of this type soon had its day, and people saw that it was better to have life without minute imitation of nature, as in the old "conventional" ornament, than minute imitation of nature without life, as in this would-be "naturalistic" decoration.

But it is not only in the imitative arts, like painting and sculpture, and the half-imitative ones, like ornament, that life is important. It is no less essential in the purely creative art

of architecture proper. The means, indeed, by which life shows itself here are more subtle, more recondite, more hardly to be traced than those by which it enters into the works of other artists; and hence it happens that the architect is of all men most in danger of missing the quality. It was not always so. From the eleventh century to the fifteenth in England, and much earlier and later elsewhere, life is the one quality which crowns every success, and redeems almost every failure. Multitudes of the minor works of the Middle Ages would be simply intolerable without it. Their proportions, not seldom, are uncouth, and their details comparatively unattractive. A modern copy of them, reduced to the flatness and tameness by which copies are usually distinguished, would hardly be borne with even by the least cultivated people; and yet the originals attract almost everybody. In this secret of putting life into a building evidently lies the solution of many difficulties; amongst others, of the difficulty of producing artistic work at a cheap rate. The late Mr. STREET long ago remarked that ancient buildings never failed artistically for want of money: the cheapest were as good in their way as the most expensive. They could not have been so good if dignity of outline were in question, for this means height, and height means cost. Nor could they have been as good if quality of ornament were meant, for the higher types of ornament would be unattainable because of the expense. But the humblest building may equal, or even excel, the most ambitious one in this quality of life—just as the smallest plants, according to VIOLLET LE DUC, express it more forcibly than shrubs and trees. It is worth asking, then, by what means life, in architecture proper, can best be manifested, and how we can attain this invaluable effect, which will atone for so many other deficiencies, but for the deficiency of which nothing can compensate us.

Life, then, seems mainly to show itself in architecture by three things—naturalness, unexpectedness, and strength. It is probably because it involves naturalness that it is so rare in modern work; for in an artificial state of society naturalness is just what is most uniformly repressed. It belongs, in fact, only to the lowest and the highest sections of such a society; it is the first thing lost by incipient learning, and perhaps the last one regained by consummate culture. In intermediate stages, few people dare to be natural. How many living architects are there, for instance, who would have ventured to build the naïve-looking, natural, and practical flying buttresses lately uncovered at the side of Westminster Hall? Which of us would not have tried to smooth them down, to tame them and moderate them, and bring them in some kind or other of conformity to habit and custom? The building throws them out, just as an animal throws out its limbs; not where it thinks they look best, but where it feels that they will support and steady it best. This same irrepressible naturalness, this daring to do just what is wanted without regard to appearances, shows itself in almost every building that is eminent for the expression of life. Look, for instance, at the staircase turrets in the west front of Coutances Cathedral—not cramped and crowded so as to form only slight projections, but boldly detached from a corner of each tower. Few architects had dared to do anything so free and natural before; none, perhaps, would venture on such a liberty now; and yet what an almost startling effect of vigour is the result. Look, again, at our old castles, such as Pembroke. There is no regularity about them, no purposed symmetry of plan or elevation. The walls bend about and step up and down just as the ground makes it desirable. The towers are placed not where beauty but where use decided. Everything is practical and utilitarian, and even because of this the whole grouping is so natural that it almost looks like a part of nature itself. Such examples as this make one ask whether half the ugliness of modern engineering works does not spring from the engineer's endeavour not to let them be ugly. If they were only natural they would be tolerable; it is the attempt—the misplaced and unsuccessful attempt—at symmetry and regularity which leaves them so hopelessly vulgar.

Unexpectedness—the next means by which life is exhibited—is perilous if not accompanied by reasonableness. In itself it implies an approach to the border-line which divides the sublime from the ridiculous; and yet the nearer it approaches to this line without crossing it, the more surely the effect of life is realised. Nothing can come much nearer to the critical point than the great figures of oxen, which look out of that most unexpected place, the top of the north-west tower at

Laon. They are a decided surprise ; and yet, when one comes to know that they are meant to commemorate the great service done towards the building of this church by the cattle which were employed to draw the materials from afar, one feels it to be a reasonable as well as a kindly impulse which led the old workmen thus to preserve the memory of their humble fellow-labourers. But even in the smallest details, where much repetition takes place, the skilful introduction of the unexpected is the only way to prevent weariness and satisfy. In the diaper patterns, for instance, with which the Eleanor Cross at Geddington is almost covered, nothing but uniform repetition at first shows itself. Every square, on a hasty examination, seems to be fitted with the same sort of flower, or the same number of leaves, arranged in the same way. If this really were so, to have seen one square would have been in effect to have seen all ; and nobody would interest himself in looking further. But, on quietly examining the work, we come here, as everywhere in genuine art, on little breaks in the pattern, and find in one place a different sort of leaf, and in another no leaf at all, but a field mouse or a lizard snugly coiled up where we expected a leaf to be. It is just such "surprises" as these which distinguished the productions of the artist from those of the machine, the living from the lifeless ; and many things, like irregularities in the spacing of an arcade or the width of a bay, which most people complacently set down as masons' blunders, are just those refinements of self-concealing art which give to old work its never-dying charm.

Strength is no less essential to the expression of life than naturalness and unexpectedness : but it needs to be remembered that strength is one thing and clumsiness another. Just as bulk, in an animal, may denote great muscular power, or may indicate only a large accumulation of fat, so it is in a building. It is not uniform massiveness that suggests strength, so much as special solidity where solidity is evidently wanted. Norman buildings, as a rule, were massive everywhere—in walls, in piers, in vaults : but they suggest heaviness rather than power, fat rather than muscle. And the fact that two of our cathedral towers have failed within the last five-and-twenty years, from the weakness of the immense Norman piers on which they rested, show that appearances in this case are not misleading. It is not the uniform overlaying of a building with twice or ten times as much material as it needs which will impress the beholder with its strength and permanence : it is rather the concentration of great solidity on critical points. The columns in a Greek building, the piers and buttresses in a Gothic one, are evidently the parts on which everything depends ; and it is these which are pre-eminently distinguished for power and rigidity. Above the columns and between the buttresses there is room for lightness and grace ; and if these qualities were absent, strength itself would not look half so strong as it does by contrast with them.

#### ROYAL ACADEMY LECTURES.\*

THE readers of *The Architect* do not need to be told that Mr. HODGSON, the Royal Academician, is able to write well, and that his essays have a grace of style which is not imparted to a writer in books on rhetoric, or in college classes. When it was announced that an artist who was gifted with such powers of expression and whose scholarship was undoubted had been appointed to the office of Librarian and Professor of Painting, there was a general agreement that the Academicians had for once, at least, selected the right man. We are still of that opinion, although the Professor in his first and second courses of lectures has hardly done justice to himself. It would be impossible for a man endowed with so many gifts to deliver a lecture which was unprofitable, and, in the volume before us, there is much which a student can utilise. But it must be said that the task undertaken in the delivery of the two courses was one which no man could execute with satisfaction to himself or to his audience. In his preface, Mr. HODGSON suggests the kind of lectures which he desired to give, and we are confident that if he had carried out his own plan students of art, nay, every reader of his book, must have been indebted to him. Mr. HODGSON as an Eastern traveller knows the distinction which the Turks make between verbs of opinion and verbs of knowledge. The latter are used whenever a man speaks with the certainty that is derived from his

own experience, the former when he speaks from hearsay. In anything that comes from Mr. HODGSON, we expect preponderance of words which are inspired by knowledge, and the preface confirms the expectation. "If I were five-and-twenty again," he writes, "knowing what I know now, I would build my life on other lines." That of course is impossible, but I can help others who are only five-and-twenty to do it. Experience, suffering, and mistakes have in my own case not been wanting, and some wisdom this book of mine must contain, if it is only that which resides in HORACE's dictum—*Amara lento temperet risu*. . . I have endeavoured to impart what things I have learnt, what maxims have come to me through experience, and I myself have been the whetstone which has sharpened my own satire." What could be more useful for a young painter than a book which was so inspired, especially when it was known that the author by his very nature must be sincere in his utterances ? Mr. HODGSON could have produced a book that would come home to the bosoms as well as to the business of artists. But as soon as he ascended the rostrum he appears to have abandoned his plan, and instead of speaking of what he had seen and felt, like a man who had history within himself, he discourses just as any official might whose world was a library, and who can placidly contemplate men as if they were intended to be puppets for the use of book-makers. Mr. HODGSON surveys mankind, not only from China to Peru, but throughout a wider region ; he regards the past as well as the present, and with easy confidence justifies the ways of heaven to earth. The history of art from the time of the Greeks to the nineteenth century is despatched in half a dozen lectures, and three lectures suffice for the Primitive or the Hieroglyphic Period, the Transition or Naturalistic Period, and the Renaissance or Poetical Period. With the utmost deference to the Professor, we say that those subjects are not adapted for an hour's lecture. TURNER was able to represent half a county in a vignette, but hitherto it has been found impossible to compress the history of any age into a few pages of manuscript. An aspiring haberdasher might take up the subjects as readily as he discusses the relation between geology and revelation, the origin of languages or the like, and amaze himself and the members of the village institute by his familiarity with the past. In an Academy address we expect more recognition of what is feasible. Men who observe limits in painting and sculpture should know that the writer's field of vision is not boundless, and that selection is as necessary in one case as in the other. It is easy enough to accumulate materials about the history of art. And it is plain that Mr. HODGSON was overpowered with them, and possessed far more than he could have opportunity to use in his lectures. We see this when we find that the fiction is introduced of the prospectus of an imaginary book on art by a German professor, of which the following is a sample :—"Migrations of the Teutonic nations : their Medo-Persian origin. Gloomy superstitions. Love of fighting and field sports : falconry. They are converted to Christianity. The Zend-Avesta not quite forgotten," &c. There is no reason why Mr. HODGSON should not discuss those subjects, or others equally remote, but whether they would form advantageous lectures for Academy students is another question, and they certainly appear to be out of place in a book where the author says, "My experience, my sufferings, my own mistakes may have enriched my mind ; I, too, may have a message to convey to suffering mankind, which may have its humble usefulness." That message will be gratefully received whenever it is delivered, but a substitute for it is not to be found in "Preliminary Considerations towards the Formation of a Scientific History of the Revival of Art in Europe."

It would be impossible in a newspaper review to follow out all the subjects for discussion which are to be found in Mr. HODGSON's historical sketches. About many of the topics introduced it is hopeless to expect unanimity, and we do not quarrel with him when we find that he adopts a different interpretation to our own. It is, however, more pleasant to consider the parts of his lectures in which Mr. HODGSON is not trammelled by historical research or theology, and where one can recognise the author's own thoughts. And, in the first place, it should be stated that the lectures show a more catholic spirit than is commonly found in the Academy. The first President who set the example of delivering formal discourses cared little for anything that was not in the grand style, or outside the Roman, Florentine, and Bolognese

\* *Academy Lectures.* By J. E. Hodgson, R.A. Trübner & Co.

schools. The Venetians, Flemings, and Dutchmen were considered by Sir JOSHUA as departing "from the great purposes of painting and catching at applause by inferior qualities." His example has been followed by successive Professors, and from time to time various schools have been held to be outside the pale of art. Mr. HODGSON is more generous. He says that whenever he pays a hurried visit to the Academy it is probable that he restricts his attention to the little "Garvagh Raphael" and one of the "Metzus." If it be said that a liking for pictures which differ so much denotes some want of balance, he defends himself by saying, "I know that I do admire them both; that, dissimilar as they are, they each give me intense pleasure; and our enjoyments in this world are not so numerous that we can afford to be always appraising them to see if they are really worth the market value; let us accept them, and be thankful." This spirit operates throughout the lectures, and whenever Mr. HODGSON introduces the name of an artist or a school, we are sure to hear of good qualities. Take, for example, the Venetian and Dutch schools, which, as we have seen, did not gain the approval of Sir JOSHUA REYNOLDS. Mr. HODGSON, when describing the Venetians, is not oblivious of form, but his value of the colour element is very different from Sir JOSHUA'S:—

The Venetian painters were nursed in the midst of gorgeous colour, and their art was inspired by it. In Titian's mind colour did for everything; it was religion, it was poetry, it was history, it was pathos and it was laughter, it was fact and it was fiction. He knew everything that it could do; he was as subtle as Raphael in another way. Take the colour out of a picture of Titian's, and it falls to pieces; the *Bacchus* and *Ariadne* is no longer Bacchanalian, *The Entombment* is tragic no more. He is the painter of painters who cannot be engraved. His vigour of mind was extraordinary: he was the shrewdest of painters, his judgment as applied to art was unerring, and he never missed his aim; what he undertook to do he realised. The Virgin translated to heaven in clouds of glory, the body of the Saviour carried through the twilight to the sepulchral grotto, the saintly monk beset by ruffians in the forest, the nymphs and fauns of Greek mythology—every scene he undertook to paint lives before you. He, moreover, invariably gives you the keynote of it, that which is most characteristic and essential in it, and he elevates everything into a high intellectual region. His work baffles analysis. I think it possible, by attentive study of Raphael, to divine the secret of his effect and to discern the means; it is impossible with Titian.

Mr. HODGSON expresses ideas which are about to prevail when he praises Dutch art. But he takes higher ground than the majority of critics, and argues that the art is "imaginative since it is full of beauty, and it is also emotional." The painters were able to express the beauty which a keen eye can discern in household utensils and in the huts where poor folks live, they made the best of their conditions, and for all we know to the contrary may have helped their neighbours to be satisfied with the simple life which they were compelled to endure. The artists did not paint for foreign critics who had derived their notions from southern schools, and to judge of their works properly we must imagine ourselves to be Dutchmen. The lesson to be derived from their works by an English artist is one of content—to accept the inevitable and to make the best of it:—

To us, who practise the art under somewhat similar restrictions, this ought to be a source of encouragement and consolation; however narrow the field, there will always be new ground to conquer. It is no good sighing after a state of things which has passed away for ever; what we have to do is to accept present conditions cheerfully, and then to see whether, even under these, some new and great result may not be achieved. We shall get no good to ourselves by sweeping generalisation or promiscuous classification, neither shall we learn anything from conventional criticism.

Fortunately for themselves the Dutch painters were able to find patrons who were satisfied with homely subjects, and who believed that it was an advantage to have more or less relation between the scenes that were transacted in a room and the scenes which were depicted on the walls. In no country has art been more popular than in Holland. The future of art in this country will also depend upon popularity; but what does that word mean in the nineteenth century? Pictures are so often bought with an eye to the auction-room it is difficult to ascertain what are the qualities which will give most pleasure and insure the success of the pictures which are yet to be painted by the young men who are now Academy students. Mr. HODGSON is of opinion that the grand style and great themes are not likely to be revived. Naturalism is hopeless

and unproductive, realism is beginning to be played out. The art of the future, according to Mr. HODGSON, is likely to have some affinity to the poetry of TENNYSON in literature, to the spirit which is seen in TITIAN'S *Entombment* and in TURNER'S *Old Temeraire*—an art which will suggest that in the painter's mind "external phenomena and events are merely reflected, glassed upon its surface, as accidental and fugitive things."

## THE OLD MASTERS AS REPRESENTED IN THE ART LOAN EXHIBITION, GUILDFORD.\*

IT will doubtless be remembered that on the postponement last year of the proposed Art Loan Exhibition I gave, by the kind permission of the then mayor, Mr. Alderman Triggs, and of Mr. Alderman Upperton, who is, I am happy to say, our worthy mayor on the present occasion, a lecture on exhibitions in the dining hall at Abbot's Hospital, in which I expressed my conviction that there were art treasures enough in this neighbourhood to form an exhibition of a most interesting and instructive kind, and knowledge enough in selecting and arranging them to make such an exhibition well worthy of patronage. That this prognostication has been amply fulfilled I think we have sufficient proof. We have not only an art loan exhibition but something more, namely, a very complete exposition of certain departments of archaeology and of natural history. These, however, with many others, are outside my province. Profiting by the reproof given to the cobbler of antiquity I confine myself to that domain of art with which, from long study and experience, I may claim some familiarity, namely, the works of the old masters, and I will, therefore, proceed to comment on some of the more important and valuable of these works; and to indicate, more especially, their influence on the development of art and of culture in England. I must, however, beg you to bear in mind, first, that the remarks I am about to make are not in the ordinary sense of the term critical remarks; and next, that because I am perforce compelled to leave many pictures unmentioned, it is not that I consider them devoid of interest or of merit. Now all who are in any way connected with art know the value of contrast, and if we would rightly understand the characteristics of painting in its revival from the thirteenth to the sixteenth century we must compare the methods then used with those employed by the ancients. The great technical distinction then between the two is this. The ancients practised painting in distemper, that is, in colours mixed with size and similar glutinous materials; and also in encaustic, that is in colours mixed with wax which were then fused together by the application of heat; but they were entirely ignorant, we are justified in believing, of the effects produced in painting by mixing the colours with oil. On the fall of the Roman Empire, when ancient civilisation was swept, as by a deluge, from the surface of Europe, painting with her sister arts perished. In Constantinople or Byzantium alone, the capital of the eastern division of the Roman empire, the tradition and practice of art, corrupt indeed but still technically valuable, survived, and by the Greek artists of that city who wandered abroad in search of employment it gradually spread over Southern Europe. The works thus produced were quaint in the extreme, mere repetitions of what may be termed a conventional or symbolic pattern; sometimes expressive of devotional feeling, but without beauty either of composition, or form, or light and shade, or colour. Nevertheless from this germ was developed a perfect vehicle for the expression of supreme beauty by the consummate genius of a Raphael. Convention, then, when once it emerged from the enervating influence of the lower Greek empire and became interpenetrated by the warmth of the fervid genius of the south, burst the bands that cramped its growth and developed like a mighty tree spreading abroad its branches, grateful in shade, beautiful in blossom, rich in fruit—a joy for ever. The productions of the earliest Italian artists, however, differed but very little from those of their Byzantine instructors. They were produced in distemper, and the surface was afterwards protected by an oil varnish. Of these works the exhibition is fortunate enough to possess two, namely, a triptych representing a *Madonna and Child*, with two saints (No. 1 in the catalogue), and No. 3, described as *The Marriage of St. Catherine*. These pictures, though somewhat obscured—for it is the nature of oil varnishes to become darker by age—are, as illustrating the earliest phase of painting, among the most interesting in the exhibition. A decided step in advance is shown in No. 9, representing *The Crucifixion, Via Crucis, and Deposition*, attributed to an artist of eminence in the fourteenth century termed Giotto, so called from his skilful imitation of the style of the most famous Italian artist and architect of the preceding century, Giotto, whose bell-tower, or campanile as it is termed, inlaid with precious marbles, and standing close to the cathedral of Florence, is one of the most beautiful structures in Italy. In this picture the artist, not content with mere fixed attitudes, gives us movement, depicts the progress of events, and, in a word, enters

\* A lecture delivered in the Town Hall, Guildford, by Mr. Thomas Whitburn, June 19, 1884.

the domain of history. A work of similar character, but still more advanced, is No. 6, termed *Atalanta's Race*, by Sandro Botticelli, also of Florence, who flourished about a century later, being born in 1437. He was originally a goldsmith, but love of painting caused him to change his profession; and his works, highly appreciated in his lifetime, but then neglected, have once more come into repute. The most important, however, and certainly the most beautiful of these early Italian pictures is No. 10, a *Holy Family*, by Ridolfi Ghirlandajo. Here, in the softness, clearness, and, as it is termed, luminousness of the colouring, we see one of the important improvements effected by the introduction of oil-painting in Italy. For the use of oil as a vehicle for the whole of a picture was not an Italian, but a Flemish invention. Up to the year 1410 pictures, as I have already stated, were painted in distemper, and finally coated with an oil varnish; but in that year, as nearly as can be ascertained, a painter of Flanders, named Hubert van Eyck, used thin linseed-oil such as this [oil exhibited] instead of size, to mix his colours with, and then added to each colour before using it a drop of varnish composed of amber dissolved in oil by means of heat. The colours thus dried with a lustre, they were less liable to injury from damp, and the final varnish was dispensed with. The amber varnish which I here show you is, there is every reason to believe, from researches made into the subject, identical with that which Van Eyck employed. The process of oil-painting was perfected by John van Eyck, a younger brother of Hubert, of whom there are several very fine and admirably preserved specimens in the National Gallery. Concerning this invention of oil-painting much controversy has arisen. It has been asserted vehemently, and especially by some Italian writers jealous for the honour of their country, that oil was used as a vehicle before Van Eyck's time, and there can be no doubt of the fact. But it was used merely for portions, accessories, and ornaments of a picture, and it was used in a thickened state such as I here show you; so that it would have been impossible to execute with it delicate and subtle imitative effects such as Van Eyck and others after his time produced. This picture, then, by Ridolfi Ghirlandajo is an admirable example of the Flemish method as practised by the Italian painters. It differs in some respects technically from methods afterwards employed, but it has merits peculiarly its own, and deserves admiration and attentive study. Another example also of the same period and style is No. 2, *The Annunciation*, by Lorenzo di Credi, a fellow-student with Leonardo da Vinci, and one of the first to adopt the method of oil-painting when introduced into Italy. An interesting example of the early Flemish manner is seen in the picture by the elder Breughel, No. 93. What art gained after this period was greater freedom, precision, and power. Up to the time of Titian, Correggio, and Raphael, it had been beautiful indeed, but fearful, as it were, of transgressing rules and proprieties; but in the hands of these great masters it developed its latent powers and took its place in the world dowered with the splendour of colour, the mystery of shade, and the majesty of expression. Of the Venetian school, of which Titian was the acknowledged head, we have two interesting examples in No. 25, a *Holy Family* by Andrea Schiavone; and No. 23, a *Holy Family* attributed to Bonifazio. By Correggio we find a characteristic sketch, No. 16, showing how great was the effect of softness and relief which this painter could produce with the minimum of labour; and also a head, *Ecce Homo*, No. 20, which, though small in size, is worked up to the highest degree of finish. Of Raphael we can show no original example, but an interesting copy of his famous *Madonna della Seggiola* in the gallery of the Pitti Palace, Florence, is seen in No. 111. Later masters are exemplified in works by Domenichino, No. 15 representing a head of *Junio*, and No. 30, termed *Elijah in the Desert*. Also by Sasso Ferrato, No. 19, depicting a *Virgin and Child*; and by Claude, No. 24, which is a small and early but beautiful specimen of this great landscape painter. But leaving, perforce, the Italian masters, let us turn to what in one sense more immediately concerns us, namely, art in England. In this department we shall find the collection peculiarly rich. True, we have none of the earliest examples of portrait painting in this country, for portrait painting, or the delineation of individuals, seems always to have taken a prominent place amongst us; but we are able at least to start with Holbein, of whom, in the portrait of *Edward VI.*, No. 91, we have a characteristic and excellent example. Born at Augsburg in 1498, Holbein was contemporary with the most famous artists of Italy, and as his father and uncle were artists of repute, there can be little doubt that the pencil was amongst his earliest playthings. Of his proficiency at the age of fourteen we have conclusive proof in the fact that he took at that age portraits of his father and his uncle, which are engraved in a splendid work termed "*Academia Artis Pictoriæ*," containing the lives of the painters, and published in 1675 by an artist and writer on art named Sandrart; and the massive volume (there are two of them) containing these portraits I here show you. That his reputation as a portrait-painter speedily became established is certain, and this was furthered by the warm recommendations of Erasmus, whose friendship he obtained, and whose portrait he painted about the year 1519. At this time the Earl of Arundel, passing through Basle, where Holbein then resided, strongly recommended him to visit England, but he put off this journey till

the year 1526, and before going he determined to leave behind him as a kind of jest a specimen of his imitative skill. Having just finished one of those works with which, from the Royal Academy Catalogue, we are so familiar, namely, the portrait of a gentleman, he painted on the forehead the portrait of a fly. Attempting to brush it off, the owner discovered the deceit, and the painter's fame spread, as is usual from tricks of this kind, far and wide. Arriving in England, he at first resided with Sir Thomas More, and then, given employment by Henry, he depicted that monarch and his court in the portraits which are so familiar to us. But I must mention, what we are very apt nowadays to forget, that Holbein was by no means a portrait-painter merely. With us art has become so sub-divided that it is rare to find a man who excels in more than one branch of it; but in the time of Holbein an artist meant a man who could build a palace, and decorate its walls, and design its furniture, and lay out its gardens, and contrive its fountains, and make statues and portraits of its possessors; nay, could even give patterns for the hilts of their daggers, and the jewellery which adorned their persons. Now, all these things, and perhaps more, Holbein could do, and probably did. Most, if not all, of his work of an architectural, sculptural, decorative kind has perished; but in his portraiture he still lives and to him we are indebted for the most faithful delineations possible of the great actors at one of the most momentous periods of our history. As an illustration of the versatility of the great artists of that period, I here show an autotype of a work of an exceedingly rare and beautiful kind, namely, a head modelled in wax attributed to Raphael, and preserved in the Museum at Lille. Raphael, it is well known, occasionally exercised his genius in architecture, and that he sometimes attempted sculpture a statue of the prophet Jonah by him testifies.

The reign of the sixth Edward was too short to be of any import to the arts; but in the reign of Mary, and especially in the much longer one of Elizabeth, we find that several painters of renown visited this country and left works behind them which are still highly prized, and of which excellent examples may be found in the present collection. Thus of Antony Moro, commonly called in this country Sir Antonio More, who died in 1581, we have a very fine specimen in the portrait of Sir Thomas Gresham, No. 87. With the individuality characteristic of Holbein, this picture combines a power of modelling and an effect of light and shade learned from study of the best masters of Italy. Cornelius Ketel, again, court painter to Queen Elizabeth, produced some very good work, as seen in No. 80, representing William Gresham; whilst by Zuccheri, also a favourite painter of the period, we have among other portraits, the famous one, No. 107, of the Queen represented as not only splendidly attired, but what she valued possibly quite as much—youthful and beautiful. The high finish of this picture in all its details is well worthy examination. Another very interesting portrait of the Queen, but at a different age, and in a less happy state of mind, is No. 96. The face is well painted, but it is difficult to name the artist with certainty. It bears the initials C. K. A popular painter in the succeeding reign, at least at court, was Paul Vansomer, by whom we find in No. 97 an ably-executed and characteristic head of Sir Nicholas Kempe, a friend of Archbishop Abbot, and a benefactor to the hospital of this town. Vansomer came to England in 1606, and remained here till 1620, during which time he painted the King and the principal nobility. He appeared to great advantage at the Art Treasures Exhibition, Manchester, 1857, where many fine works were shown by his hand.

As a patron of art and artists, however, James was far surpassed by his son, the unfortunate Charles, who—his political mistakes apart—was a prince of rare accomplishments. In the commencement of his reign Rubens who—strange union!—combined painting and diplomacy, visited this country as envoy from Spain, in order to negotiate a peace with that country. In this he succeeded, and he also left a fine example of his decorative skill in the ceiling of the Banqueting House at Whitehall, now transformed into a church. Of portraiture in this country we do not find that he left many specimens, in fact he only painted portraits on exceptional occasions, preferring historical or sacred subjects, but in the portrait of a burgomaster, No. 70, we have a very vigorous and skilful impersonation by his hand of a substantial Flemish merchant. It is to the most famous of his scholars, however, Vandyck, that England owes great part of her wealth in portraiture. Born in 1598, just a century after Holbein, and similarly gifted with precocious genius, he entered as a youth the studio of Rubens, and soon displayed such marked proficiency in portraiture that he was advised by that great painter to devote himself wholly to a branch of art in which he seemed certain to excel. Taking this advice, he set out at the age of twenty-three for Italy, and went first to Genoa, and afterwards to Rome, where he met with the celebrated Cardinal Bentivoglio. This prelate, distinguished both as a diplomatist and historian, would doubtless have preferred to have had his portrait painted by one of the great artists of his own country, but unfortunately the most eminent of them were dead. Titian, the greatest in portraiture, had died in 1576, three years before the cardinal was born, so he wisely made the best of circumstances, and having a liking for the artists of Flanders, to which country he had been sent as

legate, he welcomed the opportunity of immortalising himself through the pencil of Vandyck, and the result was a picture which spread the fame of the artist throughout Europe as the first portrait painter of his time, and which is now one of the principal ornaments in the magnificent collection in the Ducal Palace, Florence. During my residence in that city I had frequent opportunities of seeing this picture, and I there purchased an engraving of it which I now show you. So highly was this picture esteemed that the French, when they overran Italy, transferred it with other pictorial treasures to the Louvre, but at the peace it was restored. To obtain the original is of course impossible, but we are fortunate in being able to show No. 21, an excellent full-sized copy of it, and a valuable illustration of what may be termed Vandyck's Italian manner. To this period of his career also belongs the excellent portrait of a Genoese lady, No. 61. The number of portraits Vandyck painted during his residence in England (he died at the early age of forty-three) is prodigious. Necessarily he had many able assistants, the most skilful of them being Dobson—termed the Vandyck of England—by whom we have a fine full-length portrait, No. 84, of Richard, Earl of Portland, Lord Treasurer and Knight of the Garter. Dobson, whose genius was discovered by Vandyck by the accident of seeing a picture of his in a shop window, succeeded that great artist and became sergeant-painter to the Court, but he died not long after at the age of thirty-six.

And now it may not be amiss to say a few words on the vexed question of pictorial authenticity. If I were to read you a list of the artists who visited or resided in England from the reign of Henry the Eighth to that of the first of the Georges, you would be surprised at the number, but nevertheless *bored*, and the greater proportion of these, it must be borne in mind, were skilful painters, and either assistants or imitators of the artist most in vogue. It can be readily understood, then, that as Aaron's rod transformed swallowed up the other transformed rods, so the greater reputation of the ablest painter of any epoch absorbed minor reputations, and the consequence is that the works of a school, as it is termed, that is to say of the scholars or imitators of any particular master, are commonly assumed to be his. It must not be by any means supposed that these paintings are wanting in merit. They are, on the contrary, often but little inferior to those of the artist copied, for, being thoroughly grounded in what may be termed the grammar of art, all artists formerly possessed considerable technical skill, however deficient they might be in grace or power of composition or expression. Still, degrees of merit, slight though they may appear, are really very important, and authenticity in art will always retain its value.

After Vandyck, the painter who enjoyed the longest reign of popularity in England was Sir Peter Lely. Arriving here shortly after Vandyck's death, he was speedily introduced to King Charles, who was always ready to encourage talent, and he first painted the King's portrait, and then, it is said, that of Cromwell. On the Restoration he became high in favour with the second Charles, who conferred on him the honour of knighthood, and the beauties of whose Court he painted in costumes which can scarcely be called of that period, or indeed of any period. The two portraits above us are stated in Russell's "History of Guildford" to be by his hand; and the exhibition possesses one specimen, namely No. 112, a portrait of Rachel, Lady William Russell. Of Kneller, also a foreign artist, who was made a baronet by George I., and who came to England in 1674, and resided here nearly fifty years, the exhibition is fortunate enough to possess a very fine example in the portrait of the celebrated John Evelyn, author of "Sylva," No. 71, and also a very interesting one in No. 72, of Sarah, Duchess of Marlborough. Kneller, whose principal object seemed to be to amass money, in which he achieved considerable success, produced a vast number of works varying greatly in merit. When he chose to take pains his work was in certain technical qualities excellent, and it is often valuable as representing the celebrities of the day, but it seems cut out too much after a mechanical pattern; one portrait is, as regards attitude and arrangement of colour, very much a repetition of the rest; we weary of the monotony, and it remained for Reynolds, Gainsborough, and their contemporaries to once more invest portraiture with pictorial interest, and to raise it again to the height from which it had declined. One portrait painter, however, of the intermediate period, Jonathan Richardson, merits commendation; his portrait, No. 108, of the Right Hon. Arthur Onslow, Speaker of the House of Commons, being both well painted and well preserved; and by a great painter whose fame has become a national possession, and who must be considered antecedent to Reynolds, we have two valuable examples of portraiture in this collection. The first, No. 45, painted in conjunction with Sir James Thornhill, represents certain prominent members of the House of Commons; and the other, No. 60, gives a life-like delineation of the celebrated Horace Walpole.

I will now say a few words on the important subject of picture preservation—a subject on which a great deal of misapprehension has at various times prevailed, but which I nevertheless hope to make to some extent intelligible to you. I have stated that on the revival of painting in Italy in the thirteenth century the method termed distemper painting, that is to say, colours mixed with size and similar glutinous substances, and not with oils, prevailed, but that the picture thus produced was, when finished, protected from

damp by an oil varnish applied to the surface, and which was made usually of a gum termed sandarac, dissolved in linseed oil by means of heat. This varnish preserved the picture, it is true, but it had the great defect of becoming darkened by age, and the invention of oil painting consisted at first in the mixing the colours with oil, and adding to them, at the same time, a small portion of oil varnish to give them brilliancy; or if oil alone was used with the colours, and they dried dull, a coating of spirit varnish—that is, of gum or resin dissolved in spirits of wine, naphtha, or turpentine—was applied for the same purpose. These spirit varnishes are transparent, and some of them are colourless, and they have the advantage of being removable from the picture, if necessary, with much less danger of injury than an oil varnish. I here show you a bulky volume of somewhat heavy reading (it weighs seven pounds and a half), which was published by authority over thirty years ago, and which contains the opinions of all whose evidence was then thought valuable and could be procured, on the proper treatment of pictures by the old masters. That these experts differ widely enough on some points may be imagined; but on one at least the majority of them agree, namely, that oil or oil varnish ought not to be employed on the surface of an old picture. I lay the more stress on this from having seen many instances where serious and even irreparable injury has resulted from the improper use of such materials. This volume, then, is one of the many which have to be mastered by those who desire to become experts or connoisseurs; for knowledge of this kind comes not by birth, nor by inspiration, but by long experience and labour. It is a curious and remarkable fact that many of the earliest oil-paintings produced four and a half centuries ago are fresher and sounder than many that have been painted within the last century; and this is owing not only to the method of the old masters being a simple and right one, but also to the fact that they spared no pains to procure materials of the best quality, and then to purify them to the utmost possible degree. For these processes a vast number of receipts are given in the early treatises on art, of which these volumes contain a few, and I here show you some samples of linseed oil refined in some of the modes here prescribed. It is, you will perceive, as bright and clear as chrysolite. Moreover, prior to being refined, it had been kept for thirty years, for age improves oil for painting by allowing the mucilage or coarser filaments to settle at the bottom. Here is some mastic varnish of the same age, in which you will observe the same process of depositing a sediment, the varnish itself remaining now perfectly bright and clear, and you can understand that if this sediment remained in the oil and the varnish, and were mixed with the colours of, or deposited on the surface of a picture, considerable deterioration or obscuration of it might after a time result. But to pursue this subject further might be tedious, and as this art exhibition professes to be, and indeed is, essentially a local one, I think I may venture to say a few words in conclusion on the productions of an artist, who, although not literally an old master, has, nevertheless, been dead long enough to enable his works to be judged dispassionately, I allude to our distinguished townsman, John Russell, R.A.

Although occupying a prominent place in the world of art, and enjoying an ample share of Court patronage during his lifetime, he has for many years, to the general public at least, been almost unknown. In the catalogue of the famous Art Treasures Exhibition, Manchester, in 1857, when the object seemed to be to display the progress of portraiture in England in as complete a form as possible, his name does not once occur; nor is it to be found in the catalogue of the Great Exhibition at London in 1862, when English art from the commencement of the last century was again largely represented in all its varieties; and this is the more remarkable, inasmuch as many of those whose portraits he took were men of note. It seemed, then, to the Selection Committee that this opportunity should not be allowed to pass of displaying as large a number of his works as possible. Their requests for the loan of them have been most liberally responded to, and the result is a collection showing such versatility and power as to strike the cultivated beholder with astonishment and admiration. That he was the ablest crayon portrait painter that England has produced is, I think, generally admitted, but that he possessed powers in oil which place him side by side with Gainsborough and Reynolds was little suspected; nevertheless few, I think, will be disposed to dispute his title to that position who see his grand full-length portrait picture of *Admiral Onslow Receiving the Dutch Flag after the Victory of 1797*, which is one of the most skilful and effective works in the exhibition. Again the delicacy of his miniatures and smaller crayon sketches is admirable, and would alone suffice to gain for any artist a great reputation. There is an old and somewhat trite proverb that a prophet has no honour in his own country and amongst his own people, but this, I think, for once is satisfactorily disproved. We have not left to any other place the task of teaching us the duty of recognising and appreciating the works of a man of genius born among us, but we have seized, and most effectively used, the first opportunity for this that has presented itself, and there can be no doubt that the great feature of the exhibition—the one that will give it rank and character among the art exhibitions of the country—is this admirable collection of the works of Russell.

## DUNFERMLINE ABBEY.

THE west window of Dunfermline Abbey has been filled in with stained glass, at the cost of Mr. Andrew Carnegie, the founder of the Free Library and the Carnegie Baths. About two years ago, when Mr. Carnegie visited the abbey, and was looking at the stained-glass windows in the church, he stated to Mr. George Robertson, custodian of the abbey, that he had always had a desire to see the large west window filled in with stained glass with historical figures. He offered to be at the expense if the Commissioners of Works would allow him. This consent was given, under the condition that the design met the approval of the board. Mr. Carnegie asked Sir Noel Paton to make a design in accordance with his (Mr. Carnegie's) ideas. Sir Noel having undertaken the task, a sketched design was submitted to the Board of Works, and approved of by them. Mr. Ballantine was afterwards chosen by Mr. Carnegie and Sir Noel Paton to execute the glass. The work since that time has been proceeded with, no effort being spared by them to render the result satisfactory to all concerned, both in an historical and artistic sense. Mr. Carnegie has seen the work from time to time, and has not only expressed his satisfaction but has contributed many valuable suggestions in respect to the intended effect. The filling-in of the window has caused much alteration in the church in the way of removing the balcony which crossed and so much disfigured the window, and also in restoring the structural lines of the window to its original state. A new access to the steeple had also to be formed; and though this is not yet begun it will shortly be so, and when finished will afford a safe and commodious mode of ascending the belfry, which has been much repaired. The whole cost of the works is to be borne by Mr. Carnegie. There are four prominent ideas in the four lights of the window—these are Unity, Piety, Liberty, and Victory. The left centre-light represents Malcolm III., King of Scotland; under him Scotland was united. That unity cost murder, suffering, and death. Malcolm's father, Duncan, was murdered by Macbeth; his grandfather, Malcolm II., was assassinated; and his great-grandfather, Kenneth, was murdered, and at last Malcolm Canmore and his eldest son were killed at the siege of Alnwick. The right centre-light represents Queen Margaret. The fingers of St. Margaret are fixed on the Bible, showing personal piety. The marriage of Margaret with Malcolm III. was the most auspicious event in the history of this country. She was born in Hungary, but she was English in all her associations till she was married. She brought with her a better civilisation than the nation was possessed of. Sir William Wallace represents Liberty, and Robert the Bruce, Victory.

At the unveiling of the window the following letter from Mr. Carnegie was read:—

"MY DEAR MR. ROBERTSON,—As I am not to be present at the unveiling of the window, I beg you, on my behalf, to hand it over formally to the proper authorities.

"I believe the people of Dunfermline will find in this window a work of art not unworthy of the dear old abbey, nor of the great artist, their distinguished son, whose heart has been in the task throughout. I rejoice to say that in the selection of the characters to be commemorated Sir Noel and myself were equally enthusiastic. Our patron Saint Margaret taught others to read, and the book she holds tells the secret of Scotland's glory. She has educated her children for centuries, and these in turn have placed to her credit a greater amount of solid achievement than any other aggregation of four millions of people will pretend to claim. You have The Bruce, after repelling foreign aggression, sheathing his sword; and Wallace protecting lovely Scotland, who, cowering at his feet, craves his aid. In this man, neither king nor noble, but one who lived and died one of ourselves, a man of the people—a man whose fame grows greater and greater as his deeds are studied, and the history of his time is unfolded; a character which realises our loftiest ideal of patriotism—it is in him, I trust, as I did in my youth, the young men of my native town will find their true hero. I am gratified beyond measure that I have been able to add an attraction to the old abbey of my love.—Very truly, your friend,

"ANDREW CARNEGIE."

Sir Noel Paton, in regretting his inability from illness to be present, says, in a letter to Mr. Robertson:—

"I am glad it has been resolved upon to inaugurate the window with some amount of ceremony; for, whatever may be its shortcomings as a work of art, it is a munificent gift to Dunfermline, and it is meet that it should be received with all due honour by the fellow citizens of the big-hearted donor, to whose princely liberality they are so deeply indebted."

It is said that Sir Noel Paton received 2,000*l.* for the design, and Messrs. Ballantine 350*l.* for the glass work. To this falls to be added extensive alterations on the building, which will raise the cost to about 3,000*l.* Mr. Carnegie's total gifts to Dunfermline during the past ten years amount to 17,000*l.*

The *Conversazione* of the Royal Academy was held on Wednesday evening.

## ARTISANS' DWELLINGS IN BIRMINGHAM.

ON Tuesday last the Mayor of Birmingham asked the Town Council to approve of the report of the Artisans' Dwellings Inquiry Committee, and that the same be referred to the Public Works and Health Committees with instructions to carry out, as far as possible, such recommendations contained therein as related to their respective departments. The Mayor said that in regard to the report on the number of void houses there was cause for congratulation. There was a percentage of 14.57 of void houses where rents did not exceed 2*s.* 6*d.* per week; 8.60 percentage of void houses with rents between 2*s.* 6*d.* and 3*s.* 6*d.* per week; and a percentage of 6.78 of void houses with rents between 3*s.* 6*d.* and 7*s.* per week. It was satisfactory to find that the largest number of voids was in the poorest class of houses. It indicated that where the working classes could pay for higher-rented houses they were willing to do so, and it showed to those proposing to build houses that there was really a field open for them in building a class of houses which were in most demand by the artisans of the town. He hoped that the Council would not understand from the report that the houses in the borough were, from a sanitary point of view, all that could be desired, for many of the lower-rented houses were erected without any regard to building regulations. Thanks to the work of the committee, the houses in many cases had been cleansed and repaired, and the formation of the committee had led to an immense amount of good work being carried out in this and other directions. The committee thought that many of the houses rented from 2*s.* 6*d.* to 3*s.* 6*d.* a week might be condemned; but what would have been the consequence? In his opinion it would have driven many of the people perhaps into the workhouse, for, earning but one pound a week, they could not pay higher rents; or it would certainly have sent them into lodging-houses, and subjected them to the many consequent evils, so that the remedy in such cases would be worse than the disease itself. Many of the landlords of these small properties were in as poor a condition as the tenants, and it would be exceedingly harsh to close such houses without giving some compensation. To his knowledge landlords had expended as much as they could afford in repairing these properties, and the difficulty would be to remove them. He trusted that as the leases of some of the wretched little places expired, the owners would see their way clear to dispose of the land at reasonable rates to those who desired to erect suitable artisans' dwellings. The first recommendation of the committee—"that all new houses should be certified by some competent official before the same are allowed to be inhabited"—would, he thought, if carried out, have more effect than the visits of the inspectors during building operations. The second recommendation, urging that extreme care should be taken by the building surveyor in the supervision of materials used, was particularly necessary, because it was found that many houses were built of the most wretched bricks and mortar, not worthy of the name by which they were called. It was most desirable that the staircases of new houses should be better constructed, and the coroner was perfectly justified in continually drawing attention to the question, and the committee in their report had recommended such better construction. The other recommendations in the report, as to employing scavengers and whitewashers to cleanse the worst courts occasionally, the lighting of courts, better closet accommodation for children, cheap trains and tramcars, and the erection of model dwellings by private enterprise, were of an important character. With regard to the lighting of the courts, the Gas Committee would undertake to place a lamp in a court, at a charge of 34*s.* per annum for gas, or with an additional 6*s.* per annum for the lamp to remain the property of the landlord of the court in which it is placed. As to the erection of model buildings, he thought that, while it was not the duty of any local authority to provide houses for the people, it was the duty of that authority to give every facility and encouragement for the provision of such houses. It was true there were several building societies in the town, and most of them seemed to have money in hand with no employment for it. There was a field now open for them to invest this capital if they were content with a moderate return for their money. The committee were assured on all hands by the working classes that they were willing to pay for a good house as much as 5*s.* or 6*s.* a week, and good houses certainly ought to be provided at such a rental. In conclusion, he expressed the hope that one of the results of the inquiry by the committee would be that further attention would be drawn to the subject, and that some body of gentlemen would make the experiment of providing suitable houses for the artisans of the town.

The report was adopted, subject to some amendments, one of which was:—"That the Improvement Committee be instructed to consider how the principle of rent collection, as devised and carried out by Miss Octavia Hill in London, can be applied to the area under their control, and to report to this Council thereon."

The Lord Mayor will distribute the medals to the successful British exhibitors of the late Amsterdam Exhibition, at the Mansion House, on the 30th inst.

## NOTES AND COMMENTS.

THE proceedings at the sale of the Leigh Court Collection to-day (Saturday) will be watched with much interest. It is fitting that works by old masters should be found in public galleries, but they are not always equally suitable for private houses. Are amateurs to compete for the canvases with as much determination as was displayed at the sales of the HAMILTON and FOUNTAINE collections? If they do, there is no doubt that the price of a great many works which have long been lying in the dealers' hands will be immediately raised. Several of the pictures should be secured for provincial galleries, and some very useful examples are not likely to reach extravagant figures. There are, for instance, five works by the CARACCI, and if Sir JOSHUA REYNOLDS is to be taken as an authority, no artists are better deserving of a student's attention. The *Creator Mundi* ascribed to DA VINCI may not be an original, but it is at least a good example of Milanese work. The *Venus and Adonis*, by TITIAN, has more evidence in its favour, and is sure to realise a large sum. NICHOLAS POUSSIN's *Plague of Athens* is another useful work, on account of the severity of the style, although it must be said that no modern artist could well adapt it as a model. The three English works in the collection—viz., STOTHARD's *Canterbury Pilgrims*, HOGARTH's *Polly Peacham* and *Shrimp Girl*—should certainly be bought for one of the national galleries.

AN Association of Science and Art Teachers has been formed, and a conference of the members was held last week at Liverpool. The first resolution that was passed was in opposition to the present system of departmental scholarships. Successful students have now to pass their terms in South Kensington or Dublin, and it is said with reason that the prize-winners would be more satisfied if they could live nearer their homes; and, besides, a resident scholar would often be a benefit to a local science or art school. The association has been formed to promote education in science and art and the general advancement of the teachers. The following branches have been already established:—Manchester, 54 members; Liverpool, 55; Birmingham, 55; Newcastle-on-Tyne, 23; Leeds, 16; Sheffield, 14; Burslem and Northampton, 7.

A FEW months only have elapsed since Mr. WHITELEY'S premises were destroyed by fire, and already arrangements have been made for rebuilding them. Designs have been prepared, the quantities have been taken out, and the tenders have been submitted. No less energy will be shown in the works. One contractor has offered to rebuild the premises in the short space of four months, and the longest time required was only ten months. The tenders for the works vary from 59,710*l.* to 69,643*l.*

THE Charing Cross Bridge has been often pointed out as an example of what can be done towards spoiling an excellent position. Bad as it is, it will shortly be more of an eyesore, for the directors have obtained powers to widen the bridge on one side. The Victoria Embankment was planned so as to diminish as much as possible the defects of the bridge, recesses for steamboats having been formed on both sides and at equal distances from it. The Metropolitan Board of Works have been unable to prevail on Parliament to do more than introduce a clause in the Act, by which it is provided that the Board may at any time during the construction, or after the completion of the widening of the bridge, alter and reconstruct the face of the embankment under and on either side of the bridge, and rearrange the structure of the embankment so far as may be proper to maintain its symmetry and architectural character, all reasonable cost to be repaid by the company to the Board. In case of any difference between the company and the Board as to the desirability of such alteration or as to the cost of it, the point is to be determined by an architect appointed by the president for the time being of the Institute of British Architects, at the request of either party.

WE have already given an abstract of the recommendations of the City Companies' Commission, although the report was not published until this week. The annual income of the London companies is estimated as between 750,000*l.* and 800,000*l.* The capital value of the property owned by the

companies has not been estimated by experts, but it cannot be less than fifteen millions sterling, and in twenty-five years may amount to twenty millions. The rateable value of the halls of the principal companies is about 35,000*l.*, and the value of the plate and furniture 270,000*l.* The minor companies' halls are rated at about 20,000*l.* a year. It has been calculated that 175,000*l.* is expended yearly in rebuilding, repairs, payment of rates and taxes, and other charges connected with the halls, almshouses, schools, and buildings occupied or used by the companies, and improvements on their estates.

AN interesting report on the progress of Victoria has been presented to the Colonial Office. The annual value of rateable property in the municipalities of the colony at the end of 1882 was 7,433,812*l.* During eight years the total increase in the annual valuation amounted to 1,438,335*l.* The land alienated in fee-simple during 1882 was 442,009 acres, and the amount realised therefor was 598,079*l.*, or at the rate of 1*l.* 7*s.* 1*d.* per acre. The total extent alienated from the first settlement of the colony was 13,056,499 acres, for which 20,780,859*l.* was paid, being at the rate of 1*l.* 11*s.* 10*d.* an acre. The amount of building may be inferred when it is said that in 1882-83 there were over 95,000,000 bricks produced in the brickyards. Masons, plasterers, bricklayers, and carpenters are paid from 10*s.* to 12*s.* a day, without rations.

THE story has been revived according to which the statue of ADDISON in Westminster Abbey is not a portrait of the essayist. A picture was used by the sculptor, which was taken from Holland House, but afterwards it was discovered that the subject of it was Sir ANDREW FOUNTAINE. The statue was described by MACAULAY as being "skilfully graven." It represents ADDISON, he says, "as we can conceive him, clad in his dressing-gown, and freed from his wig, stepping from his parlour at Chelsea into his trim little garden, with the account of the Everlasting Club, or the Loves of Hilpa and Shalum, just finished for the next day's *Spectator*, in his hand." ADDISON died in 1719, and it is hardly credible that in little more than a century Holland House should have lost all clue to the authenticity of the portraits. On the other hand, the portrait is not characteristic, and doubt would seem to be implied in MACAULAY'S description. "The features are pleasing, the complexion is remarkably fair, but in the expression we trace rather the gentleness of his disposition than the force and keenness of his intellect." Another remarkable circumstance which adds to the puzzle is the number of miniatures of ADDISON which exist. They are apparently eighteenth-century work, and they correspond fairly well with the Holland House portrait. Notwithstanding all these portraits, when his essays and plays were published after his death there was no engraving of ADDISON in the volumes, although skilful etchers abounded in those days.

AT present there about seventeen hundred men employed in the construction of the Ship Canal across the isthmus of Corinth. On account of the scarcity of labourers in Greece, and the higher wages demanded by them, the workmen consist principally of Italians and Montenegrins. A large dredging machine has arrived at the works, and another has been ordered. Judging, however, from the progress already made, it seems probable that more than double the time originally calculated (which was fixed at three years) will be requisite for the completion of the works. The canal, when finished, will no doubt be generally used by steam vessels from the Adriatic bound to Athens and Constantinople, and *vice versa*. But it appears doubtful whether it will be much employed by British merchant steamers in the Mediterranean, either going to or returning from Constantinople and ports in the Black Sea, excepting during heavy weather and gales, when the route by the canal may be preferred to encountering detention by rough and stormy weather off Cape Matapan.

ACCORDING to the report of Dr. APPELL, of the South Kensington Museum, 884 publications relating to fine art, or especially useful to art students, have been issued during the year 1883. They are as follows:—310 publications in English, 292 in German, 223 in French, 28 in Italian, 16 in Swedish and Danish, 8 in Dutch, and 7 in Spanish. 781 of these publications have been acquired for the National Art Library, namely, 307 English and 474 foreign works.

## ILLUSTRATIONS.

BRYERS, WINDERMERE.

THIS house, now in course of erection for Mr. J. R. BRIDSON, is situated at Sawrey, on the Hawkshead road, near Windermere. An old farmhouse and cottage are being converted into kitchens and offices. The new building contains the entertaining rooms, which are so placed as to command the best view of the lake. The stonework will be from local quarries, with red sandstone dressings, the upper portions being in post and plaster, with some parts tile hung. The roofs will be tiled.

Mr. R. KNILL FREEMAN, F.R.I.B.A., of Bolton-le-Moors, is the architect.

DRAWING-ROOM, BLACKHEATH, CLONTARF, CO. DUBLIN.

THIS drawing-room was erected some time ago from the designs of Mr. THOMAS DREW, R.H.A. As the scenery in the neighbourhood of the house is picturesque, ample window space was given to allow of its enjoyment, and the style was considered to be suitable for a district in which before the Union Classical houses were not uncommon.

DOUBLEBOIS, CORNWALL.

THE accompanying illustration shows the principal and entrance fronts of the residence now in course of erection for Mr. GEORGE E. HERMON, at Doublebois, near Liskeard. The house is situated on the side of a steep hill, sloping towards the river Fowey. It commands extensive views over the valley and well-wooded hills opposite, and is sheltered on the north and east by rising ground and a belt of trees. The main walls of the house are built of local stone rock faced externally, with brick linings, and a hollow space as a protection against damp. The strings and quoins are of granite, the general dressings of Hamhill stone. The interior is finished chiefly in pitch pine, but the dado and other joinery in the drawing-room and chimneypieces and overmantels are of teak. The house is being lighted by atmospheric gas by Messrs. EDMUNDSON, of Great George Street, S.W. The ornamental glazing generally is being executed by Messrs. FOURACRE & WATSON, of Plymouth.

The general contractor is Mr. PETHICK, of Norley Yard, Plymouth, who is also building lodge, stabling, gardener's house, hot-houses, &c.

Messrs. CHRISTOPHER & WHITE, of 16 Bloomsbury Square, W.C., are the architects.

ENTRANCE LODGE, ROUNDHAY, LEEDS.

THIS lodge has been erected upon the estate of Mr. THOMAS GREEN, at Askel Hill. Handsome stables have been built. Extensive alterations and additions have been made to the house, and terraces of dressed stone laid out in front. A new carriage drive has been formed across the valley, with a stone bridge over the stream.

The whole of the works were carried out from the designs and under the superintendence of Mr. JAMES WILSON, architect, of Leeds, at a total cost of 6,000/.

MILVERTON HOUSE, MOSELEY, BIRMINGHAM.

THE house shown in the illustration is one of the oldest in the Birmingham district. It has lately been remodelled under the direction of Mr. L. W. GOOLD, and now forms a comfortable residence.

## MANCHESTER SOCIETY OF ARCHITECTS.

A REPORT of the Manchester Society of Architects to the non-metropolitan members of the Royal Institute of British Architects has just been issued. It deals with the proceedings instituted so long ago as February, 1882, to bring about some modification of the rules of the Royal Institute so as to give non-metropolitan Fellows a better opportunity of making known and giving effect to their views on any important matter affecting the profession generally. The result of the inquiries and correspondence is thus stated:—"It will be seen that in the opinion of the legal adviser of the Institute, the charter stands in the way of any modification of the arrangements such as were suggested by the

Joint Committee, and although the Council of this Society is not prepared to consider that the charter dated 1837 should be allowed to cripple that which should be an important and powerful association fifty years afterwards when circumstances have entirely changed; still, it would be fair to wait the result of the suggested modifications which will be tried at the next elections of officers. It is evident that it is the desire of the Council of the Institute to meet the wishes of the non-resident Fellows as far as practicable, and as it must also be the desire of all the members to increase the powers of the Society to its fullest extent, and to make it what it should be—a society representing the profession throughout the whole country—it is in the opinion of this Society advisable to keep the matter in view, and to bring it forward again if the arrangements now being carried out in the election of officers for the next session are found not to have the desired effect."

## MR. RUSKIN ON MINERALOGY.

THE annual meeting of the Mineralogical Society of Great Britain and Ireland was held in Edinburgh on Tuesday. Professor Geikie acted as chairman, in the absence of the president, the Rev. Professor Bonney.

The first paper read was one by Professor Ruskin, on "Forms of Silica." The author began by congratulating the Society on this occasion of its meeting in the capital of a country which was itself one magnificent mineralogical specimen, reaching from Cheviot to Cape Wrath, and which concentrated into the most convenient compass and presented in the most distinctly instructive form examples of every mineralogical phenomenon and process which had taken place in the construction of the world. He also felicitated himself on the permission thus given him to bring before the members a question which in Edinburgh of all cities of the world at present constructed it should be easiest to solve, and which (his father being Edinburgh born) was very early submitted to his childish mind, and had been more or less the occupation of his best wits ever since—in vain—the production, namely, and the painting of a Scotch pebble. He was the more happy in this unexpected privilege because though an old member of the Geological Society, his geological observations had always been as completely ignored by that Society as his remarks on political economy by the directors of the Bank of England; and although he had respectfully solicited from them the charity of their assistance in so small a matter as the explanation of an agate stone on the forefinger of an alderman, they still discoursed on the catastrophes of chaos and the processes of creation, without being able to tell why a slate splits or how a pebble was coloured. In Scotland the main questions respecting those two main forms of silica—pebble or crystal—were all put to them with a close solicitude by the beautiful conditions of the agate and the glowing colours of the cairngorm, which had always variegated and illuminated the favourite jewellery of Scottish laird and lassie. Might he hope, with special reference to the

Favourite gem  
Of Scotland's mountain diadem,

to prevail on some Scottish mineralogist to take up the hitherto totally neglected subject of the relation of colour in minerals to their shape and substance; why, for instance, large and well-developed quartz crystals were frequently topaz colour, a smoke colour—never rose colour; while massive quartz might be rose colour and pure white or grey, but never smoke colour. Again, why amethyst quartz might continually, as at Schemnitz and other places, be infinitely complex and multiplex in crystallisation, but never warped, while smoky quartz might be continually found warped, but never in the amethystine way multiplex. Why, again, smoky quartz and cairngorm were continually found in short crystals, but never in long slender ones; while beryl was usually short and even tabular, and green beryl long, almost in proportion to its purity. Might he also hope that the efforts of the Mineralogical Society might be directed to the formation of a museum of what might be called mineral geology, showing examples of all familiar minerals in association with their native rocks on a sufficiently large and intelligible scale. Proceeding with the subject matter of his paper, Professor Ruskin pointed out that there were at least six states of siliceous substance which were entirely distinct—flint, jasper, chalcedony, hyalite, opal, and quartz. They were only liable to be confused with each other in bad specimens; each had its own special and separate character, and needed peculiar circumstances for its production and development. In support of his view, the Professor directed attention to a beautiful collection of precious stones which had been sent to illustrate his paper from his museum at Sheffield. Another point was that contorted gneiss, which had hitherto been explained as produced by lateral pressure, was due to crystallisation. After describing the distinguishing characteristics of the specimens, and where they occurred, Professor Ruskin submitted that no movement of rocks on a large scale could ever be explained until they understood rightly the formation of a quartz vein and the growth—to take the most familiar of fusible minerals—of an ice-crystal. And he would

especially plead with the younger members of the Society that they should quit themselves of the idea that they needed large laboratories, fine microscopes, or rare minerals for the effective pursuit of their science. A quick eye, a candid mind, and an earnest heart were all the microscopes and laboratories which any of them needed, and with a little clay, sand, salt, and sugar a man might find out more of the methods of geological phenomena than ever were known to Sir Charles Lyell. Of the interest and entertainment of such unpretending science he hoped the children of this generation might know more than their fathers, and that the study of the earth, which hitherto had shown them little more than the monsters of a chaotic past, might at last interpret for them the beautiful work of the creative present, and lead them day by day to find a till then unthought-of loveliness in the rock and a till then uncounted value in the gem.

The Chairman, commenting on the paper, said that the whole question of the origin of those forms of silica was an extremely difficult one, and expressed his conviction that it could hardly be so interpreted as Professor Ruskin would make out.

### SOCIETY OF ARTS.

THE council of the Society of Arts have awarded the Society's silver medals to the following readers of papers during the session, 1883-4:—To the Most Hon. the Marquis of Lorne, K.T., for his paper on "Canada and its Products." To Rev. J. A. Rivington, for his paper on a "New Process of Permanent Mural Painting, invented by Joseph Keim." To C. V. Boys, for his paper on "Bicycles and Tricycles." To Professor Fleeming Jenkin, F.R.S., for his paper on "Telpherage." To I. Probert, for his paper on "Primary Batteries for Electric Lighting." To H. H. Johnston, for his paper on "The Portuguese Colonies of West Africa." To Professor Sylvanus P. Thompson, for his paper on "Recent Progress in Dynamo-Electric Machinery." To Edward C. Stanford, F.C.S., for his paper on "Economic Applications of Seaweed." To W. Seton-Karr, for his paper on "The New Bengal Rent Bill." To C. Purdon Clarke, C.I.E., for his paper on "Street Architecture in India."

Thanks were voted to the following members of council for the papers read by them:—To W. H. Preece, F.R.S., Vice-President of the Society, for his paper on "The Progress of Electric Lighting." To B. W. Richardson, M.D., F.R.S., Vice-President of the Society, for his paper on "Vital Steps in Sanitary Progress." To Col. Webber, R.E., C.B., Member of Council, for his paper on "Telegraph Tariffs." To B. Francis Cobb, Vice-President of the Society, for his paper on "Borneo." To J. M. Maclean, Member of Council, for his paper on "State Monopoly of Railways in India." To W. G. Pedder, Member of Council, for his paper on "The Existing Law of Landlord and Tenant in India."

### THE ARUNDEL SOCIETY.

THE report which was read at the 35th annual meeting of the Arundel Society states that there had been a considerable falling off in the receipts during the past year, and at the same time an increase in the expenditure. The position of the Society, however, is so strong that the exercise of a moderate economy will, it is hoped, speedily restore its financial equilibrium. There had been a considerable accession of new members, and the work of the Society is being pursued with the usual steadiness and success. The first publication of the present year, distributed among subscribers, is taken from the frescoes of Benozzo Gozzoli in the Riccardi Chapel at Florence. The second will be from the frescoes in the refectory of the convent of St. Mark at Florence, attributed in part to Fra Bartolommeo, and in part to Sogliani, and representing the supper and miraculous vision of St. Dominick and his brethren. Next year the illustration of the Riccardi Chapel will be continued in the first annual publication, which will consist of a chromolithograph corresponding to that brought out this year, and representing the group of angels on the other side of the chapel altar. The second annual publication for 1885 will be a chromolithograph, now being prepared by Herr Frick, from a painting by Fiorenzo di Lorenzo, a rare Umbrian master of the fifteenth century. Its subject is *The Miraculous Cure of a Wounded Man*, by S. Bernardino. Of the three chromolithographs mentioned in last year's report as preparing for publication in the occasional class, one only has been yet brought out, that executed by Herr Frick, representing the allegorical figure of Theology. This, with the three similar subjects of Philosophy, Jurisprudence, and Poetry, printed in colour, completes the illustration of the series of such figures painted by Raphael in the Vatican. The other two proposed chromolithographs, one representing the *Nursing of Bacchus*, from an antique Roman wall painting, the second the *Annunciation*, from a picture attributed to Simone Memmi, are still in preparation. Mr. Perkins's introduction to the illustrated work on Italian sepulchral monuments was completed and brought out in the autumn of last year. Signor

Desideri has copied the four allegorical groups painted in fresco by Paolo Veronese in the Villa Masere, and has since been making drawings from the series of paintings by Vittore Carpaccio in the church of St. Giorgio dei Schiavoni at Venice, illustrating the lives of St. Jerome and St. George. All the copies from Paolo Veronese, and one of those from Carpaccio, are now on view at the Society's rooms. A water-colour drawing by Signor Constantini, after the picture of *Spring*, by Sandro Botticelli, now in the Academy of Fine Arts at Florence, was bought by the council last year, and may also be seen at the Society's rooms. Regret was expressed at the meeting at the death in December last of Mr. F. Lambe Price, the Society's secretary. Mr. Douglas Hamilton Gordon has been appointed his successor, with Mr. A. H. Brice as assistant.

### ARTISTS AND DEALERS.

A REMARKABLE interpleader suit arising out of the case of *Musson v. Holland* was heard last week at the Nottingham County Court. Five paintings by Mr. John Holland, a Nottingham artist, which were among those exhibited in the Art Museum, Nottingham Castle, had been seized by an execution creditor. It was alleged by Mr. Bestow, a picture dealer, that the pictures were his property, although exhibited in Mr. Holland's name as if unsold. It appeared that on January 1, 1881, Mr. Holland agreed that all the pictures which he painted should be exclusively for Mr. Bestow, who, from time to time, supplied him with money as he required it, and also with paints, canvas, &c. About 800*l.* had been paid, and Mr. Bestow received from Mr. Holland pictures which he had painted. The latter, in 1883, was induced to give a bill for some gambling transaction, and that bill was discounted by the execution creditor (Mr. Musson). Mr. Holland was sued upon the bill, and there being no defence, judgment was given against him. This, however, was never mentioned by him to Mr. Bestow, who was in ignorance of it. At that time Mr. Bestow had in his possession the five pictures which had been sent to him by the defendant, unframed. They consisted of three oil paintings and two water-colours, which were painted subsequently. They were framed for the claimant by Mr. Warner, and one of them, *Fort St. Mary, Isle of Man*, was this year sent to the Royal Academy by Mr. Bestow, but it failed to obtain admission, and being brought back from London it was met at the railway station by Mr. Bestow and Mr. Warner, and, with the other pictures, was taken to the Art Museum, Nottingham Castle. It appeared that there was a rule on the minutes of the museum that all pictures submitted there for sale must be *bonâ fide* the property of the artist, and when Mr. Bestow sent the pictures in question to the Castle he entered them in the name of John Holland.

The Judge pointed out that such an arrangement was contrary to the rules of the museum, but counsel replied that one-half of the pictures exhibited in the Nottingham Castle Museum which are supposed to be the property of the artists are not so, and that a member of the Society of Artists could be called to prove the practice. But the question really was, to whom did the pictures actually belong. Five pictures were hung up in Mr. Holland's name, and they were seized by the execution creditor, but Mr. Bestow had purchased them of Mr. Holland under the agreement referred to.

Mr. Bestow said that on January 1, 1881, he made an arrangement with Mr. Holland that he should have all the pictures he painted, and he supplied him with canvas and paints. Since January 10, 1881, he had paid him above 800*l.* The five pictures were sent to witness's house unframed, and a person named Warner framed them. One of the pictures was sent to the Royal Academy, but was returned, and witness exhibited this and four other pictures at the Castle Museum. Witness had always exhibited pictures in Mr. Holland's name.

Cross-examined: Witness sent up the pictures to the Castle. It was possible that Mr. Musson, the execution creditor, might believe that under the rules of the Castle Museum authorities the pictures belonged to Mr. Holland. When a picture was sold a red star was affixed to it. If the pictures had been sold in the name of Mr. Holland, witness would have received the money from that gentleman. Witness did not take any bill of sale from Mr. Holland. He had not given a specific sum for any of the pictures painted by him. He had paid him at the rate of about 5*l.* per week.

By the Judge: The curator at the museum had a schedule of prices. Mr. Wallis, the curator, sent a message to witness, because he knew that he and Mr. Holland had business relations.

Mr. John Holland was then called, and he confirmed the evidence given by Mr. Bestow. It was true that since January 1881, Mr. Bestow had paid him 800*l.* Mr. Bestow informed him that he proposed to send the five pictures to the local artists' exhibition at the Castle, in witness's name. Witness had had other pictures exhibited, which he painted, but which did not belong to him.

The Judge said that so far the evidence showed that Mr. Holland, who belonged to an honourable profession, acted in contravention of the rules of the authorities of the museum.

In cross-examination witness said the Art Union of Notting-

ham was formed for the protection of young artists, but the latter, he thought, had no better friend than Mr. Bestow. He did not think there was a single artist in Nottingham who had not infringed the rule laid down by the authorities of the museum.

Mr. Redgate stated that it was an ordinary thing for artists to send pictures to the museum in their name although they had previously been sold. The rule was constantly broken, and the committee of the museum knew this to be the case.

Mr. Samuel Holland said he was one of six gentlemen who composed the council of the Nottingham Society of Arts. The rule referred to was never taken any notice of. The rule was to break the rule.

By the Judge: He could not say why the rule had been made, or why it had not been repealed.

Examination continued: He was aware of the arrangement existing between his brother and Mr. Bestow.

Cross-examined: Mr. Wallis knew of the arrangement for constantly breaking the rule. Witness was both an exhibitor and a member of the hanging committee. He believed that those of the public who were interested in art knew that there were gentlemen in the background who were the real owners of some of the pictures exhibited.

The Judge said he thought the committee ought to be aware whether the pictures were the property of the painter in whose name they were exhibited. Mr. Bestow would receive from the curator the value of any picture sold of which Mr. John Holland was the painter.

Mr. Warner said he knew that Mr. Holland was painting all his pictures for Mr. Bestow. Witness framed pictures for Mr. Bestow. The painting, *Fort St. Mary*, was sent to the Royal Academy, and when it was returned witness took it with four other pictures to the Castle Museum.

Counsel for the judgment creditor said that, notwithstanding the agreement between Mr. Bestow and Mr. Holland, the exhibition committee had no knowledge but that the pictures belonged to the latter, and the execution creditor seized them, believing *bonâ fide* that Mr. Holland was the unencumbered owner of the pictures. It was quite clear that Mr. Bestow might have perfected his title to the pictures by having the red star affixed to them, and by having it inserted in the catalogue that he was the owner of them, but he understood that the public would not like it to be known that the exhibition, instead of being for the benefit of rising local artists, was turned to the advantage of speculators.

The Judge said his impression was that the rules of the exhibition committee had been broken, but he thought on the whole of the evidence the pictures were in truth the property of Mr. Bestow, and that from first to last he had used them and disposed of them as his property. The sole question was whether this was affected by the fact that the pictures were exhibited in the defendant's name. Under the circumstances, looking at the position and conduct of the parties, he should give judgment for the claimant, but he should not give any costs whatever.

The Judge allowed the pictures to be given up to Mr. Bestow, but his honour thought the possession money ought to be paid by the claimant.

### SCHOOLS OF ART IN ITALY.

THE following notes on schools of art applied to industry in Milan, Bologna, Padua, Venice, Rome, Naples, and Florence have been prepared by Mr. Thomas Armstrong, the Director for Art under the Science and Art Department:—

While in Italy, during the months of November and December, on business connected with the museum, I was able to see something of the schools of applied art (*Arte applicata all' Industria*) in the towns I visited. Generally I found activity on the part of the governing bodies and eagerness for instruction among the working classes. There is no uniform system for the whole of the kingdom, but in essentials the course of instruction, which in its lower stages is very much like our own, was the same in all the schools I visited. The programme of a State-aided school must be approved by the Minister.

Though the systems resemble our own, their application is made under very different conditions. The schools are free, and there is no such thing known as payment by results. There are prizes and certificates, but they are not very numerous or important, and the student comes to the school for instruction which shall be useful to him in his actual or future calling. He has to submit to follow the course laid down in the regulations of the school which, in the earlier stages, is common to all; but the professor, when a certain degree of efficiency is attained, puts each to do that kind of work which has the most direct bearing in his trade. The objects of the schools, as declared in the programme of that of Padua, are:—"To provide elementary instruction in geometry applied to the arts, in constructive drawing applied to the work of the joiner, the builder (mason, or bricklayer), the carver, &c., and in ornamental freehand drawing applied to these trades; in elementary architectural drawing, and in modelling in its various applications." This is the programme and from what I saw I think that it is well carried out.

The artisans I saw at work were for the most part engaged in the building trades, where the work is heavy and the hours of labour are much longer than in England. I was struck by their orderly behaviour, their attention to their work, the tidiness of their appearance and, above all, by the neat and cleanly manner in which their drawings were executed, which, considering the rough work they had been at all day, seemed extraordinary. I noticed that there is, among the class which feeds these schools in Italy, a greater appearance of material well-being than could be seen three or four years ago. The schools are generally supported by joint contributions of the municipality, the provinces, the Minister of Agriculture and Commerce, and sometimes by the Chamber of Commerce of the town.

In Milan there is an artisan school for art applied to industry, in the Brera, adjacent to the Academy of Fine Arts. It is open from six to eight in the evening, and inscribed on its books are from 800 to 850 students, who are bound to attend regularly, for he who is absent three nights in succession without giving a proper explanation loses his place. There were at that time 400 candidates waiting for admission when room could be found for them. I visited the school on a Saturday night, when the attendance is always thinner, but I found some 600 students. Most of these were doing the kind of work produced in our art classes, and, so far as I was able to examine, it was generally good. There were thirty modelling. This school was in many respects the most interesting I saw from its numbers and its appearance of vitality; but there was nothing in the system of instruction differing from our own which I thought worthy of note, with this exception, that elaborate shading is not encouraged. In this particular we stand alone. In the schools I visited the shading was generally done with lead pencil, and, though the work was careful and neat enough, there were none of the large and very carefully shaded drawings which are common with us. It is supplemented by a "Superior School of Art applied to Industry," which is lodged in the same building with the Civic Museum of Applied Art in the Public Gardens.

At Bologna I found a school in which there were 65 students at work drawing at desks, in a well-lighted room, from flat examples, for the most part of ornament. I found the young men were joiners, masons, decorative painters, and workers in metal. I saw the more advanced of the two sections, which comes to work on the evenings of Tuesday, Thursday, and Saturday. All of the students in this section had been in the school more than one year. The first year students attend on the other three nights, and draw from flat examples, something like those of our second grade. Those I saw were working from lithographs of ornament, generally shaded; but some masons were doing architectural work, and some geometry was being studied. I noticed a student who was copying a sheet of lithographs of trunks and travelling-bags, who said he was assistant to a trunkmaker, and that such practice was useful to him in his trade, as drawings had to be made whenever a new form of trunk was ordered. The drawings were generally well executed, and the copies were never of the same size as the examples. There were 105 students inscribed. Modelling is taught three nights in the winter, and is practised by many students from the drawing-class.

Professor Francesco Bonghi, who showed me the school in the most painstaking and obliging manner, said there is not the same thirst for instruction in Bologna as in Milan. He attached much importance to prizes such as were formerly given more freely by the municipality; small prizes of materials for drawing, such as paper, pencils, &c., which to the very poor made study easier. He used to have the school open on Sundays for those advanced students who were willing to come, but this practice was discouraged on the grounds that these students were taught things above their trades. Professor Bonghi has been there twenty-three years, and for the last fifteen or twenty the school must have been in much the same state as it is at present.

At Padua I saw a drawing school for artisans which is open in the evening to students above sixteen years of age who must be able to read and write. There are classes in the day-time for boys over twelve, from whom a somewhat higher qualification is required. All pass through a course of geometry. The beginners were working from an example like our second grade, drawn on a slate by the master; others were working from flat examples of ornament. A few were drawing from casts of ornament and both casts and flat examples were so disposed as to be available at the same time for a number of students. Each example in such instances was lighted by one large isolated lamp with a reflector, while each student had beside him a small shaded lamp on a stand about four feet high; this method of lighting answered very well, though the oil lamp used gives a much less vivid light than gas, to which we are accustomed. A class of eighteen or twenty were at work in another room from casts of heads and extremities, lighted in the same manner, and some were copying the Elgin horse's head and a large cast of the head of a lion. There was no modelling. Thirty-seven students were on the books for the morning classes, and thirty-six for those in the evening; some attended both. Building construction is taught as well as a little architecture, and there is technical instruction in carving wood and stone. The school is open on Sundays for those who choose to

attend. Prizes are given to the more advanced students for works of invention. In the lower stages certificates are awarded to those who are successful at the examinations. The school prizes are not given in money, but in materials, such as paint-boxes, boxes of instruments, photographs, or tools suitable for use in the technical school. Last year a wood-carver received tools to the amount of 60 lire.

The Banca Mutua Popolare of Padua gives 360 lire a year in four prizes. In these cases half the sum is handed over to the successful competitor in cash, and in a banking book, which is given to him, he receives credit for the remainder. A sum of 50 or 60 lire, arising from property belonging to a former school, is given to the best student of the year. The school itself spends about 300 lire in prizes. Silver medals are awarded.

I was shown a number of works executed by students of the school, such as plaster models of ornament, engraved wood blocks with prints taken from them, and wood carvings. The last were very good of their kind. There were wooden models of building construction done in the school, which were well executed. The school is not a large one, but it seems in a very healthy state.

There is but little encouragement, I was told, for art workmanship in Padua, so the best students go to seek work in other towns. I went to the school with no introduction, but was received in the most obliging manner by the director, Signor Cannella, and the other professors, and had the printed papers of the school given to me.

In Venice I found a very interesting school which has 125 students, with a large number, for whom there is no room, waiting to come in. I visited the school both in the evening and on Sunday morning; on the latter occasion there was an attendance of fifty or sixty. A copy of the printed programme was given to me and is to be found in the Educational Library with other documents of the same kind. The course of study is much the same as that of the upper school at Milan. I noticed large flat examples of flowers in white on a black ground.

In the first half year, after beginning with geometry and free-hand, models made of wire are used and memory exercises are done. Next comes a course of drawing which I have not seen in use elsewhere. Nature printed leaves are used as examples. The larger kinds of leaves are chosen, and the examples are made by Professor Allegri of this school. Exercises from memory are done in nearly all the courses. Here, as in Milan, the students' work, after a grounding common to all, is planned with a view to their trades.

The modellers here generally draw for a year before beginning to work in clay. I saw very good work by the more advanced students, and was much struck with hands and feet modelled after casts from nature made in the school. The examples are among the best I have ever seen of the kind, and I should be glad if the practice of casting hands and feet from nature, when good models can be obtained, could be introduced into our schools. The casts generally in use in this and other schools are excellent in their sharpness and cleanliness. Casts from worn-out moulds such as we have so long been accustomed to in our English schools are not tolerated in Italy. I was much impressed with the interest Signor Stella, the director, and his staff showed in their duties. They are doing very good work and, from what I heard in Venice, I believe their efforts are appreciated.

I visited in Rome an evening school in the Via Urbana ai Monti, which is directed by Professor Echert. The students must be over seventeen and must be following a trade. No previous practice in drawing of any kind is required for entrance, but candidates for admission have to pass an examination in writing from dictation and in the four elementary rules of arithmetic. The expenses of the school amount annually to 30,000 lire, 1,000 or 1,500 being contributed by the Minister of Agriculture and Commerce, who has the right to an annual inspection.

During the first year all do geometry. The geometrical drawings I saw, which were very neatly executed, were like those done in our own schools. They are from printed examples, never the same size, and from the black board. Decorators only work at this one year. There is one examination every year on the results of which every pupil has a certificate. Prizes are given by the municipality in money, 10, 15, or 20 lire, and others of 20 to 50 lire from the Minister, while a private person provides funds for ten others of 50 lire each. The prize works are kept by the school, and all works, good or bad, are exhibited. Materials are furnished to the students. There is no modelling done in Via Urbana ai Monti. It is taught in one of the other two schools of the same kind, but in all these schools there are only eight who learn. Modelling is allowed after one year of geometry and one of drawing of ornament. In their third or fourth year decorative painters do perspective in one of the other schools.

I saw much good work in progress, especially architectural drawings, done generally from flat examples enlarged to scale, drawings of building constructions and machinery, and wooden models of roofs. There were good shaded works from casts of plants, and very fair specimens of model drawing in Indian ink. The shading, which was generally good, was done with lead pencil. Panels of flat decoration were being done with Indian ink. Sometimes the students are set to do plans of the school building from

measurement, and the professor gives small pencil sketches of elevations, which are carried out much larger with sections. Some of these architectural drawings, being done by joiners and masons, were large, and I admired the precision and the cleanliness of the work, which seemed to me extraordinary for men who had been at hard manual labour all day, and the working-day is longer there than with us. My visit took place just before Christmas, when artisans had to keep longer hours in order to get work finished, and consequently the attendance was below the average, which I was told was sixty-five; but of 100 or 120 inscribed there were about fifty who came regularly and worked hard. Employers are generally interested in the school; they visit it sometimes, and, in engaging workmen, give the preference to those who have been educated in the school.

The attendance in the three schools, which have been in existence about ten years, has been in 1878-79, 392; 1879-80, 317; 1880-81, 323. Now the number is somewhat greater. Nothing is done in the schools from the month of June till the middle of October, when the heat is too great for nightwork in rooms lighted by gas. There are four preparatory schools where younger boys are taught simple geometrical drawing and freehand. On the other hand, the advanced students who wish to carry their studies further can go to the upper school at St. Giuseppe, Capo le Case. I was shown a book of good drawings produced in this school which had been to the Milan exhibition, and among them were some of coloured decoration. Professor Echert was most kind in showing me the school and giving the fullest explanations.

At St. Giuseppe, Capo le Case, the upper school is housed in part of a disused convent, with the Museum of Applied Art. This is an upper school which only takes students who have already had instruction and practice in drawing. A certificate from another school and an examination in drawing from a cast of ornament are required for entrance. The school is open from seven till ten in the evening, and those who choose may come to work on Sundays. I was told that those whose trades required the study of perspective, such as decorative painters, were sent elsewhere for lessons.

For admission to the modelling class no drawing in this school need be done; the modellers were mostly engaged on reliefs. A young man was working in this class who had no trade or profession; he was doing it, he said, for a pastime. In going through this and other schools I had always asked the trade of a student when I stopped to look at his work, and this was the solitary instance of this kind of student; all the others had trades.

Among those of whose work I have taken notes were many goldsmiths, some engravers and lithographers, workers in stucco, and sculptor's workmen—"practiciens." Here I met with two students who had come from what they called the "priests' school." I heard good accounts of the teaching in this school, but was never able to visit it, and, indeed, am not quite sure that it is still in existence. In the technical part of this school I saw only one student at work, who was doing a wax model of a vase which was to be cast outside, but to be chased afterwards in the school. The professor for workers in metal is Signor Buzzari, who is with Augusto Castellani, the famous goldsmith. I saw other good works by advanced students, some of them going to the Turin exhibition, by carvers in wood and marble, and a model of part of a domed ceiling by a worker in stucco. Paper, pencils, and modelling tools are provided by the school. Plastellina, which never dries, or wax is used for the smaller models. The instruction is free, and 600 lire are annually spent in prizes and gold medals of 100 and 50 lire in value are given, as well as certificates of honourable mention.

I was shown a sort of exhibition of students' works, among which were many good models in wax for metal and glass work and original works which were good in design and execution. In many of them figures, treated ornamentally, were skillfully introduced. I saw no figure studies of the full-length living model; but here, and in the other schools, I believe a student who has made a good design is supplied with living models to carry it out.

The museum was established about ten years ago in the ex-convent of St. Lorenzo in Lucina, where accommodation was provided for it by the municipality; it was thence removed to the Collegio Romano for a time, and in January 1876 it was decided to increase its importance and practical utility by establishing schools in connection with it. At first the instruction was limited to some art industries already practised in Rome, but it was afterwards thought desirable to extend its scope, so says the programme, and teach the art of enamelling on metal, which was almost unknown in Rome. I did not see any specimens of this work in the school. In April 1879 the Minister of Agriculture and Commerce took the initiative in proposing a large subsidy to the museum in order to extend its educational influence throughout the whole kingdom. Under the new arrangement the central Government agreed to contribute 120,000 lire annually, and to pay the expenses of adaptation of part of the ex-convent of St. Giuseppe, Capo le Case, which the municipality conceded to the museum and schools. The latter, moreover, increased its subsidy from 10,000 lire to 30,000 lire, so the sum available annually for the two is now 150,000 lire, or 6,000*l.* sterling. The museum possesses many interesting specimens, both originals and reproductions. Provision is made on the premises for lithography, castings in plaster, and the

electrotype process, and for the sale at a low price of the reproductions obtained by these means. I was told that the museum authorities would be glad to make exchanges with the South Kensington Museum, and I should be glad to see some arrangement made to that end.

The late Alessandro Castellani, who was much interested in its formation, presented to it, among other interesting things, a set of moulds taken from the antique terra-cottas in the Campana collection, which were bought for the Louvre, and I should like us to have casts of these. This school has the great advantage of being housed in the same building as the museum. The upper school at Milan and that at Naples are also in this favourable position, but these latter have not such good collections, nor have they at command the large means for purchase now possessed by the Roman museum. Scholarships to be held by students from all parts of Italy are included in the Act of endowment. There were ninety-six students on the register at the time of my visit.

During my short visit of two and a half days to Naples I saw, besides the important school in the museum, a small one belonging to the Co-operative Society of Workmen which, like most others in Italy, is kept up jointly by the state, the province, and the municipality. This society, which has been in existence twenty-three years has seven such schools, and they have been at work ten years. Free instruction is given in drawing and in chemistry applied to the arts. All the students—there are 350 in the seven schools—do mechanical drawing. In one school modelling is taught, and in another scientific instruction bearing on dyeing, gilding, and painting is given.\* The drawings I saw were mostly done from flat examples, such as lithographs of heads, but drawing from the cast is practised.

The large school attached to the Museum of Applied Art has very spacious rooms and is well appointed, perhaps better than any school I saw in Italy; students generally come to it from preparatory schools, but it has been found expedient to establish a preparatory course in the building, and this class has 125 students. In the preparatory course all do geometry and freehand from flat examples, like our second grade, but somewhat larger. In the elementary schools in Naples some drawing is taught along with writing, and I was told that there is a tendency in all the other schools to so formulate their system of instruction that it shall lead up to that of the one in the museum, although there is no recognised connection. Students are admitted at twelve, but may remain until they are twenty-two; as a rule they stay in the school three years, but a few, after passing an examination, are allowed an extension of two years. There were at the time five such. There is no night school, and generally students give their whole time; in the morning they draw or model, and in the afternoon do technical work. There are fifteen who receive allowances for maintenance like those granted to our national scholars.

A very interesting and novel feature in this school is the system of paying the wages of workmen of proved capacity on the days of the week when they leave their work to attend the school. Some of those who receive maintenance come from the School of Fine Arts, and much good has been done by this means in raising the tone of the rest of the school. There are 110 or 120 ordinary students who work all day.

My visit fell on the day after Christmas when there were no students, but I was taken over the building in the most obliging manner by the Secretary, who gave up his holiday time to me. Among the works remaining in the school I saw many drawings done from flat examples, lithographs, which, after being copied in the same size, are afterwards done larger or smaller. There are no large figures to draw from, only heads and extremities being allowed. Living models are only supplied when advanced students have designed important works in which figures are used decoratively. The school professes to give instruction in the modelling and drawing of ornament, and of the figure only so far as it is applied to ornament. Lead pencil and chalk are used for drawing. I saw good modelled work from shells, fruit, foliage, and fish. The students are taught to make moulds for casting in plaster. The prizes consist of savings' bank books, with deposits of sums from 10 to 50 frs.

In the technical division I was shown works in clay which had been fired; vases and candelabra, decorated with flowers and figures, and very cleverly executed; models in wax for metal-work to be carried out in the school. There were tiles painted and fired in the school, which had been commissioned by the municipality for a pavement. These were well done in a bad way, much like our own work, and not nearly so good as the common tiles which have been long made in Naples.

The museum only dates from the autumn of 1883, and has not a large collection. On the walls hang textiles, and many photographs of good decorative work. There is a good case of Persian and Hispano-Moresque ware, and of old Neapolitan tiles; also a collection of old Capo di Monte ware. Specimens are shown of the art products of Naples at the present day, and there is a good deal of French pottery and a little English.

\* The society has other functions besides teaching. It advances money to workmen for the purchase of tools, on the guarantee of one other workman. It has a Sunday school where women are taught reading, writing, arithmetic, and other things useful in social life.

On arriving at Florence I was told that the School of Applied Art was closed while alterations were being made in the building, but Signor Bardini, the dealer, said this was not the case, and that he would make arrangements for me to visit it at noon on the following day, Sunday, for I was leaving for Milan in the evening. He most kindly accompanied me, and introduced me to the professors.

This is a day-school, and has no evening classes. There are 140 students, who are all above twelve years of age, and who pay 10 lire for the year. This is the only school I saw in which payment is required. It is supported by the municipality, the province, the central Government, the Chamber of Commerce. No previous practice is necessary for admission, and beginners do freehand and geometrical drawing concurrently. For the latter the examples are given on the blackboard, and are first copied freehand, being afterwards corrected with instruments. Enlarged examples of tarsia work are used as examples, the contours in the copies being filled with a tint. Every student is bound to acquire some knowledge of architecture. For three years there is a common system for all, but afterwards the student must choose his calling and do work specially adapted to it. The school is open four hours a day, and attendance during three is obligatory. There were no students at work while I was in the school, but I saw some of their works, which, for the most part, had been done in competition. Some of them showed great skill, as might have been expected from Florentine workmen. The printed papers of this school which have recently been prepared have only reached me just as this report must go to press.

It is declared in them that the object of the school is "to give artistic and technical instruction of a kind which may best further the growth of those Florentine industries which depend on the arts of drawing and modelling." In 1883 there were only seven students out of a total of 140, and in 1884 eight out of 146, who had not chosen their walk in life, and an opinion is expressed contrary to the establishment, in such schools as this one, of workshops for technical teaching, for it is held that a youth cannot really acquire practice in manufacture elsewhere than in a place where proper conditions of reality and competition are submitted to, and when the work is fairly submitted to industrial and commercial tests.

The importance of making studies of the figure, even from the living model, is dwelt on in this programme. Although great skill is shown by Italian workmen in the adaptations of the figure to decorative purposes, I saw no study from the living model going on, and heard of very little. The practice of drawing entire figures from casts is not nearly so common in these Italian schools as with us, or even in the French and German schools. Heads and extremities seem to be carefully studied from the excellent casts which are to be found everywhere.

## UNIVERSITY COLLEGE, LONDON.

THE following students have been successful in the examinations of the architectural classes under Professor T. R. Smith:—

*Fine Art.*—Donaldson silver medal, E. Nicholson, London. 2nd prize, Jose Suarez, Bogota. Third class, W. H. Eve, London, and E. T. King, London.

*Construction.*—Donaldson silver medal, E. W. Knight, Greenwich. 2nd prize, A. T. Bolton, London. 3rd certificate, \*Frank Taylor, London. 4th certificate, \*R. M. Hamilton, New Zealand. Second class, J. R. Morgan, London, and F. W. Quick, London. Third class, T. D. Atkinson, London; C. F. Blomfield, London; E. F. King, London; F. Swift, Peckham; and J. M. Watson, London.

*Modern Practice.*—Prize, W. C. Jones, Forest Hill. 2nd certificate, \*J. R. Morgan, London. 3rd certificate, \*E. L. Conder, Leeds and London. 4th certificate, \*R. L. Cole, London, and \*W. Millard, London. Second class, R. M. Hamilton, New Zealand, and W. Quick, London. Third class, T. G. Williams, Liverpool.

\* Obtained marks qualifying for a prize.

## SOCIAL SCIENCE CONGRESS.

THE following "special questions" have been agreed upon between the local committees and the council of the Social Science Association, for discussion in the Congress, to be held in Birmingham in September next:—

*Health.*—1. What is the best method of dealing with (a) town sewage; (b) the products of house and street scavenging; and (c) the products of combustion? 2. What are the best means, legislative or other, of securing those improvements in the dwellings of the poor which are essential to the welfare of the community? 3. How far may the average death-rate of a population be considered an efficient test of its sanitary condition; and by what means can the high death-rate of children be reduced?

*Economy and Trade.*—1. Would it be advantageous to give to leaseholders powers entitling them to the purchase of the fee simple of the lands and premises they occupy, or otherwise to interfere by

law with the prevailing system of building and other long leases? 2. What has been the working of the Employers' Liability Act, 1880, and is any amendment of it desirable? 3. What is the social condition of the working classes in 1884 as compared with 1857, when the first meeting of the National Association for the Promotion of National Science was held in Birmingham; and in what way can the working classes best utilise their savings?

*Art.*—1. Ought elementary instruction in drawing to be made an essential part of the national education? 2. What is the value to the ear, the mind, the health, and the disposition of the young, produced by class instruction in music? 3. How can a love and appreciation of art be best developed among the masses of the people?

### THE CITY OF STOCKHOLM.

THE Grand Governor's office has issued a report on the city of Stockholm for the period between 1876 and 1879, containing various interesting statistics and describing all the changes and improvements that have taken place during that time.

In 1876 the total length of the streets was 38,420 Swedish feet; in 1881 it increased to 389,878 feet, or over 65 English miles. Four hundred thousand kronor, or about 20,000*l.*, were expended yearly for repairing old streets. The result has been that the unsightly and disagreeable cobble paving-stones have nearly disappeared, and been replaced either by cut stones or by macadam and asphalt, which now covers a third of the streets, against a fourth in 1876. The cleaning of the streets is, moreover, greatly facilitated by the changes, and a general improvement in their appearance is already discernible. The water supply has increased considerably since 1876, the pipes having been lengthened from about 42 miles to 56 miles, and two new reservoirs erected in the north of the town, holding respectively 2,500,000 and 2,000,000 Swedish kannor, or 1,450,000 and 1,150,000 gallons.

The drainage has also undergone great improvements. It is not long since all the liquid sewage of the town was carried away by open gutters; the streets became consequently impregnated with impurities, and the air filled with poisonous evaporations during winter months; the gutters moreover froze, and great expense had to be incurred in keeping them free of ice. After the improvements introduced in the Stockholm waterworks, plans have been laid for adopting the self-cleansing system of underground drainage through glazed earthenware pipes. The progress of these works has been considerably slow, as nearly the whole of Stockholm is built upon solid rock; but most of the principal and all the new streets of the town are drained on the new system. Formerly the landlords were responsible for the scavenging of those parts of the streets which were opposite their houses, but this old custom has been entirely done away with in the chief quarters of the town since the formation, in 1876, of a scavenging company, and the cleanliness of the streets has yearly improved.

The town has also been considerably embellished during the quinquennium by improvements in the public squares and gardens. Those especially worthy of notice are the gardens of Humlegården, which now form one of the prettiest and most agreeable quarters of the town. They were formerly used as royal pleasure-gardens, and were not opened to the public until 1820. The grounds then fell into disorder, and became the haunt of low and disreputable people. In 1870 the municipality, after repeated appeals, succeeded in renting the ground from the Crown, and in 1877 they were presented to the city by the king. Since then Humlegården has undergone extraordinary changes, and is now a great ornament to the town, and situated in the centre of the new quarter which has sprung up within the last ten or twelve years. The population of Stockholm has increased from 147,525 in 1876, to 168,019 in 1880. According to the last census of 1882, the population of the whole kingdom amounted to 4,579,115, and of Stockholm to 185,325.

The buildings erected during the period were the two classical schools of Norrmalm and Södermalm in the northern and southern quarters, the Real Läröverk or modern school, and three preparatory schools. The charity schools were also added to with four establishments. The number of private schools amounted to 123, amongst which Palmgren's institution is worthy of notice, where various handicrafts are taught, such as carpentry, turning, bookbinding, &c., in addition to the ordinary subjects of the modern schools.

### THE SWEDISH TIMBER TRADE.

ACCORDING to the annual report of the Saw Mills and Timber Exporting Association of Stockholm, the shipping of timber commenced in the early part of May 1883, and continued in most of the ports uninterruptedly until the middle of November. During that time the condition of the rivers was most favourable for floating purposes, and a larger quantity of timber was exported from Swedish ports than in any previous year. The stock of sawn goods this spring will not, however, exceed that of 1883 to any great extent, as is shown by the following comparative

statement of the stocks ready for exportation in the opening of the shipping season of 1883 and 1884 of the ports north of Stockholm:—

Districts.	Standards.
Gefle . . . . .	54,470
Söderhamn . . . . .	71,283
Hudiksvall . . . . .	28,770
Sundsvall . . . . .	112,000
Härnösand . . . . .	60,000
Örnsköldsvik . . . . .	14,450
Umeå and Nordmaling . . . . .	17,200
Skellefteå . . . . .	17,271
Piteå . . . . .	7,550
Luleå, Kalix, and Haparanda . . . . .	23,500
Total . . . . .	406,494
Against, in 1883 . . . . .	404,704

The quantity of timber, moreover, in the rivers is considerably reduced, and most of the mills will not be able to commence sawing until three weeks after the opening of navigation, which will have the effect of retarding them considerably, and of causing a falling off in the produce of 1884. The total exportation of sawn and planed goods amounted to 748,000 standards, against 715,300 in 1882, and 611,000 in 1881.

A comparison of the stocks of Swedish deals and battens at the London Docks in December 1883, with those of the same date in 1882, shows a decrease of 200,000 deals and 500,000 battens; and in other ports they are not above the average. These facts prove that the Swedish timber trade is on the increase in Great Britain. Prices were, however, on the other hand unfavourable for exporters in Sweden during the past year, showing a falling off of 10*s.* per standard, and a loss of 6,786,500 kronor, about 377,030*l.*, on the exportation of 748,500 standards. The association have, therefore, expressed their opinion that, in view of the diminished supply of timber at the saw-mills, and the increasing consumption abroad, exporters should endeavour to raise the value of their goods during 1884, and thus obtain a reasonable profit on their invested capital. They are recommended—1st, to diminish the felling of trees; 2nd, to avoid pushing the sales and issuing stock notes; 3rd, to make their offers of sale only through one permanently-appointed agent in each country; and 4th, to prohibit the agents circulating printed stock notes indiscriminately to all purchasers. By attending to these rules the association hope to maintain an even quotation of prices, and enter into a confederation with foreign buyers. The new law which has been enacted regarding the barking of all floating timber has been found most prejudicial to the wood industry of Sweden, and the association has taken the initiative in addressing a petition to the king, which has been numerously signed by persons interested in the timber trade.

One of the principal ports in Sweden for timber is Gefle. At the commencement of last year favourable sales of red wood, deals, &c., were there made to France and Spain at about the closing prices of the preceding year, or on a basis of 11*l.* 5*s.* for red 3×9 deals. As the season wore on it became gradually apparent that even stocks as published were less than the actual supply, and the consequence was that an unsatisfactory dragging trade was experienced for Great Britain. English importers bought intermittently throughout the season, and although there were great fluctuations in price, the following may be assumed as a fair average of rates in summer and autumn for good Gefle brands.

PRICES OF SAWN RED WOOD.

	Mixed.	Thirds.	Fourths.	Fifths.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.
For 9-inch and upwards deals and boards	10 10 0	8 10 0	6 10 0	5 10 0
For 6½-inch, 7-inch, and 8-inch battens and boards	8 5 0	6 5 0	5 5 0	4 10 0
For 6-inch battens and boards	7 15 0	5 15 0	4 15 0	4 0 0

PRICES OF WHITE WOOD.

	£ s. d.
9-inch and 11-inch deals and boards, unassorted and as falling	5 10 0
6½-inch and 7-inch battens and boards, unassorted and as falling	4 15 0

All per St. Petersburg Standard and free on board.

Up to the present time no business of importance has been transacted for the coming season, as both buyers and sellers are waiting for an improved demand before committing themselves. Steps have, however, been at length taken not only by the leading firms in the Gefle districts, but generally throughout Sweden, to diminish the output, which is clearly far too large for the consumption. This measure has long been seen to be inevitable, and has been taken far too tardily.

The chief industry of Härnösand, consisting of the manufacture and exportation of deals, boards, battens, and other kinds of

wood goods, was unusually active during 1883. The exports amounted to 26,585,754 cubic feet, of the estimated value of 866,052*l.*, but prices were depressed to 15*s.* below those of the preceding year. Sawmill owners have therefore determined to reduce their production to three-fourths of last year's production, in order to prevent the market being overstocked with goods.

#### Design for a Reredos.

SIR,—Your readers will duly appreciate the useful knowledge, so gratuitously imparted to them last week by your correspondent "H. E.," touching the manipulation of plates and the wholesale compilation of architectural scrap-books. As "an experienced paperhanger," he is entitled to be heard on such an important branch of industry; and if he could be induced to furnish a "loan collection" from his "piles of portfolios" to the Architectural Museum, with his own inimitable marginal notes and queries, it is quite possible that the centre of attraction might be temporarily shifted from South Kensington to Tufon Street.

Among his multifarious acquirements, he has learned the Latin for "table," and seems able to discuss the symbolic side of church architecture in a manner sufficiently incomprehensible. In the person of "H. E." we see a neglected genius whom the "trade malice" of Burlington House and the "professional jealousy" of Conduit Street allows—nay, compels—to languish in obscurity. But surely there are still openings for a pushing man. Why does not "H. E." come forward with a word in due season and settle, once and for all, the difference between Messrs. Wood and Fergusson as to the number and dimensions, the disposition and the donors, of the at present unknown number of columns in the Temple of Diana at Ephesus? Or could a more fitting man be found to follow in the wake of Sir Edmund Beckett with a second "sermon" on the west front of St. Albans, due regard being paid to the morals and the manners of the personages from time to time engaged in the general restoration?

It is, however, matter for regret that his facility in the use of the pen is not equal to his handling of the paste-brush. His style is crude and *rather* incoherent—the besetting sin of those who in literature as well as art depend upon paste and scissors as the readiest (sometimes their only) means of earning daily bread.

The author of the "Design for a Reredos" may also think him uncomplimentary and "just two to one"; but he will consider the wanton mutilation of his well-thought-out and elaborate drawing somewhat "depressing" and "a thing to deplore." The designer of the work is no doubt able to defend it; but he is evidently a man of patience, and I hope that his silence will prove him one of long-suffering. For him to notice the "art criticism" of this particular artisan would indeed be *infra dig.* Outsiders like myself will look with suspicion upon this latest and most dubious attempt to invest another man's work with "artistic merit."

Would it not, after all, be better for the "shoemaker to stick to his last"? The ordinary paperhanger is usually an inoffensive and useful enough man in his way. But the extraordinary ones who possess, or are possessed by, "artistic" instincts might keep themselves out of mischief during their leisure hours by devoting their talent to the fabrication of fire-screens and children's scrap-albums, or even the solution of "The Budget Picture Prize Puzzles."

Yours, &c.,  
INCOG.

#### LEGAL.

##### High Court of Justice.—Chancery Division.—June 19.

(Before Mr. JUSTICE KAY.)

ROBERTS v. OPPENHEIM.

OWNERSHIP OF LONDON COURTS.

The plaintiffs in this action claim to be entitled to certain houses in Winkworth Buildings, Austinfriars, and to the freehold of the soil of a court in front of those houses, which court is close to Austinfriars, and approached by steps leading therefrom; and the object of the action is to obtain a declaration of their title to this forecourt and to the areas of the houses in question, to restrain the defendant from trespassing upon the forecourt by building thereon, and to obtain an order for the removal of certain footings, pilasters, and other erections which the defendant had placed upon the forecourt. The defendant, who disputed the plaintiff's title to the forecourt, did not claim any title to it himself, but alleged that it was public property as a public highway, and that he had obtained the license of the Commissioners of Sewers for what he had done, and, moreover, that he had caused no injury or damage to the plaintiffs.

Mr. Justice Kay, after going minutely through the evidence, said it was clearly settled that the mere fact that a court or place

of this kind was a *cul de sac*, and not a thoroughfare, was not enough to negative its being a public highway, if there were other sufficient circumstances to show that it was so. Nor, on the other hand, would it cease to be private property because it was lighted by a public body or patrolled by the police. In this case, however, the evidence clearly showed that it was as much a public highway as if there had been a thoroughfare through it, and in that respect the plaintiffs' case failed. With regard, however, to those houses, the cellars of which went right across the court, the inference was that the soil belonged to the houses to which the cellars belonged, and so far as the defendant had trespassed thereon, the plaintiffs were entitled not merely to damages, but to the removal of the footings and cornices complained of. And so, both sides being to some extent in the wrong, each party must pay his own costs.

##### High Court of Justice.—Queen's Bench Division.

(Before Mr. JUSTICE A. L. SMITH.)

FURNISS v. LANGLANDS.

BUYING LAND.

The plaintiffs in this case are builders, and they sought to recover 100*l.* and interest, overpayment on a sale of land. In 1875 one of the plaintiffs and the defendant had a conversation with regard to land adjoining the property of each party in Epsom, and which it was thought would soon come into the market for sale, and it was suggested that it might be convenient for the parties to buy this land on their joint account. At the end of 1877 the defendant sent his foreman to the plaintiffs to ask if they would like to purchase the land adjoining their property, as he believed it was now for sale, and Mr. George Furniss called on the defendant, and had a conversation with him on the subject. Mr. Langlands said that he would purchase the whole of the land (about an acre and a half in extent), and whatever price he got it at Messrs. Furniss should have the part which they required (about an acre) in the same proportion as he could get the whole for. Mr. Furniss offered to negotiate for the land himself, but the defendant said that the vendors were his landlords, and he knew them so well that it would be better for him to negotiate. A few weeks afterwards Mr. Langlands stated that he had had to give 600*l.* for the land, and that the proportion which, according to arrangement, the plaintiffs would have to give for it was 400*l.* Mr. Furniss complained of the price, but said that he must have the land, although he would be giving more than it was worth. Mr. Langlands suggested that his solicitor should act for all parties, in order to save the plaintiffs some expense, to which they agreed. The plaintiffs shortly afterwards completed their purchase, and paid the 400*l.* to Mr. Langlands, taking a conveyance from him of the land in question, and they thought no more about the matter until the beginning of last year, when they accidentally discovered on purchasing other property that the defendant had not given 600*l.* for the land, as he said, but only 450*l.* They accordingly sued for the return of 100*l.* overpaid together with interest.

The jury found for the plaintiffs, and judgment was given accordingly.

##### Court of Session, Edinburgh.—June 24.

(Before Lord McLAREN.)

GEORGE BEATTIE & SON, &c., v. MACGREGOR.

ARCHITECT'S FEES.

The plaintiffs in this action are architects in Edinburgh, and they claim from the proprietor of the Royal Hotel in that city the sum of 661*l.* as balance of their fees as architects for works connected with additions to and alterations upon the hotel. These works were begun in 1875 and finished in 1880, at a cost of 26,704*l.* Mr. Macgregor engaged the pursuers as architects at a commission of 4 per cent. Their total charge was 1,411*l.*, of which 750*l.* has been paid, and the balance they now sue for. In answer the defendant states that the pursuers made errors in the levels and measurements in the new front to the hotel, by which he was prevented from utilising, as he had proposed, the old floors and ceilings; and that the pursuers granted certificates to tradesmen for payments of instalments on contracts which, when their accounts came to be adjusted, it was found that some of them had been overpaid, and he (defendant) had been unable to recover the sums so overpaid; and that his losses from these sources amount to more than the sum sued for. For this he holds the plaintiffs responsible, and intends to bring an action for the amount.

The Lord Ordinary closed the record, and sisted the case to enable Mr. Macgregor to bring his counter-action.

**Lieutenant Alex. Bleakley**, 1st Cheshire Engineer Volunteers, has been asked to assist Major Rochefort Boyd, R.E., in laying-out the camp for the approaching meeting of the National Rifle Association at Wimbledon. It is understood that this is the first time such an appointment has been offered to a Volunteer officer.

## ARCHÆOLOGY.

**The Shakespearian Epitaph.**—A letter has been discovered from one William Hall, an Oxford student, to Edward Thwaites, the Anglo-Saxon scholar, which dates probably from 1694. It relates to the verses which are inscribed on Shakespeare's tombstone, and is as follows:—"Dear Neddy,—I very greedily embrace this occasion of acquainting you with something which I found at Stratford-upon-Avon. That place I came unto on Thursday night, and the next day went to visit the ashes of the great Shakespear which lye interr'd in that church. The verses which, in his lifetime, he ordered to be cut upon his tombstone, for his monument have others, are those which follow:—"

'Reader, for Jesus's sake forbear  
To dig the dust enclosed here;  
Blessed be he that spares these stones,  
And cursed be he that moves my bones.'

The little learning these verses contain would be a very strong argument of the want of it in the author, did not they carry something in them which stands in need of a comment. There is in this church a place which they call the one-house, a repository for all bones they dig up, which are so many that they would load a great number of waggons. The Poet, being willing to preserve his bones unmoved, lays a curse upon him that moves them, and having to do with clerks and sextons, for the most part a very ignorant sort of people, he descends to the meanest of their capacities, and disrobes himself of that art which none of his contemporaries wore in greater perfection. Nor has the design mist of its effect, for, lest they should not only draw this curse upon themselves, but also entail it upon their posterity, they have laid him full seventeen foot deep, deep enough to secure him. And so much for Stratford, within a mile of which Sir Robinson lives, but it was so late before I knew, that I had not time to make him a visit."

## CHURCH BUILDING AND RESTORATION.

**Aberfoyle, N.B.**—This church has been reopened. It was erected in 1869, from the designs of Mr. Honeyman. It has now been greatly increased in size at the cost of the original donor, Mr. Hampson, and under the direction of the same architect. The addition consists of a transept, and an additional bay at the west end; the old west gable and the south porch having been carefully taken down and re-erected, and there is also a new vestry and heating-chamber, a new pulpit, which is of Caen stone and alabaster, and a new communion table. There is coloured glass in all the windows, but the west window, consisting of three lancets, is particularly worthy of notice. It is the gift of the Hon. William Campbell, and is in memory of ancestors who were natives of the parish. It is the work of Messrs. Alfred O. Hemming & Co., of London. The church is beautifully situated on a large piece of well-wooded ground, given for the purpose by His Grace the Duke of Montrose.

**Bromley Common.**—Holy Trinity Church was reopened and a new apse consecrated by the Archbishop of Canterbury on Monday, 23rd inst., after having been closed during restoration. The old building was erected about forty years ago, and was built on a very awkward plan, having a very shallow chancel, no organ-chamber, and an inadequate heating apparatus. The present additions consist of an apse (which we illustrated in a previous number), giving greater depth to the chancel; an organ-chamber, with space underneath for Grundy's hot-air apparatus; choir stalls, an oak and stone pulpit, &c.; the chancel being raised above the level of the nave floor, and projecting into the body of the church. New seating in pitch pine has been substituted in place of the old straight-backed pews. These improvements were carried out in memory of the late Mr. George Warde-Norman by his family, and a memorial tracery window of four lights, filled with stained glass by Messrs. Clayton & Bell, has been put in by the children of the late Mr. Henry Norman. The total cost of the restoration, including an organ by Mr. Henry Jones, of the Fulham Road, will be under 2,000*l.* Mr. William Smith, of Bromley Common, was the builder employed, under the direction of Mr. C. Pemberton-Leach, 31 Spring Gardens.

## GENERAL.

**Mr. Waterhouse, A.R.A.**, has been appointed architect for the new National Liberal Club, which is to be erected on the Thames Embankment, near Whitehall Gardens.

**Mr. Belt** has been commissioned to execute a bust of the late Sir Michael Costa.

**Mr. Arthur Evans** has been appointed Keeper of the Ashmolean Museum, in place of the late Mr. G. H. Parker, C.B.

**A Design by Messrs. Davis & Emanuel** has been adopted for the new London Almshouses at Brixton. The estimated cost is 8,500*l.* The second prize was awarded to Messrs. Hooker & Hemings.

**The Earl of Carnarvon**, as president of the Society of Antiquaries, and the Countess of Carnarvon, entertained the council and members of the society at an evening party, at their residence in Portman Square, on Wednesday night.

**Chevalier L. Desanges** has been commissioned to paint three whole-length portraits for the Grand Lodge of Freemasons, to replace those that were destroyed by fire last year. These portraits represent the Prince of Wales, the Duke of Manchester, and the Earl of Zetland.

**An Oak Reredos**, designed by Messrs. J. Medland and H. Taylor, of Manchester, has been placed in St. Anne's Church at Brindle Heath, Pendleton.

**The Restoration** of the tower of All Saints' Church, Springfield, has been begun by Mr. J. Brown, builder, of Chelmsford, under the direction of Mr. Fred. Chancellor.

**In the Competition** for the proposed Isle of Man Infirmary and Dispensary the committee have awarded the first premium (40*l.*) to Messrs. Wallace & Fell, of 4 Trafalgar Square, and the second premium (10*l.*) to Messrs. Alex. Bleakley and Thos. W. Cubbon.

**A Site** has been selected on the Thames Embankment for the Burns monument, the gift to the nation of Mr. J. G. Crawford. The spot is in the centre of a semicircular bank of grass picturesquely fringed with trees, and lies in that portion of the river gardens overlooked by the western end of the Adelphi Terrace. The erection of the monument will be at once commenced, and the statue will be unveiled some time in July.

**A Conversazione** will be held at the International Health Exhibition by the Council of the Society of Arts, in conjunction with the Executive Council of the Exhibition, on Wednesday evening, July 9. The whole of the buildings will be open, and the gardens will be illuminated.

**An Appeal** is made for funds to restore St. Michael's, Coventry, under the direction of Mr. J. O. Scott. The estimated cost is 35,000*l.*, towards which an inhabitant of the town has promised 10,000*l.*, on condition that a further sum of 20,000*l.* (payable in five years) be guaranteed within twelve months, and the work be begun at once and be thoroughly carried out.

**The Fountaine Collection** realised 91,112*l.* 17*s.*, the number of lots being 565. The proceeds of the Bernal sale, with 4,098 lots, amounted to 62,690*l.* 18*s.*, and the Strawberry Hill sale, which lasted for twenty-four days, only reached 30,000*l.*

**The Roman Catholic Chapel** at Wellingore Hall, near Lincoln, the seat of Mr. A. H. C. Nevile, was destroyed by fire on Sunday afternoon. The cause of the fire has not been discovered. The loss is estimated at 10,000*l.*

**The City and Guilds of London Institute** has been enriched by the following additional donations to the Equipment Fund of the Central Institution:—The Goldsmiths' Company, 4,000*l.* (subject to confirmation); the Salters' Company, 525*l.*; the Cordwainers', 250*l.* The Plasterers have increased their annual subscription from 50 guineas to 100*l.*

**Mr. Phipps** has prepared the plans for a new circus at Argyll Street, Oxford Street, for Mr. Charles Hengler.

**Portions of a Stone Font** have been discovered in the parish church at Folkestone, built into one of the old walls.

**The Designs of Mr. Alex. Bleakley, A.R.I.B.A.**, of Birkenhead and Westminster, have been selected in competition for the Wadham Road Board Schools, Bootle-cum-Linacre, near Liverpool. The buildings will accommodate 1,200 children in four departments, at a cost of 5*l.* per child. A detached house for the caretaker will also be provided at a cost of 450*l.* The other competitors were "A. B. C.," Thos. Mercer, "Rule of Three," Messrs. H. & A. P. Fry, "Bootle," Thos. Cox, "Ilex," Messrs. F. & G. Holme, "Bootle (Lighthouse)," Jno. E. Reeve, "Omnia Vincit Labor," Owen Roberts, and others.

**Ventilation Open Competition.**—At the ventilation open competition just concluded at Birkenhead, Messrs. Robert Boyle & Son, of 64 Holborn Viaduct, and Glasgow, have been awarded the gold medal, the highest and only prize offered, for their system of ventilation, it being adjudged the best.

**Messrs. Archibald Smith & Stevens**, of Janus Works, Queen's Road, Battersea, have been entrusted with an order for one of Stevens & Major's patent suspended hydraulic passenger-lifts for the Royal Colonial Institute, Northumberland Avenue.

**The Joiners** at Bradford struck work on Monday morning. The men seek to fix the rate of wages paid to men of average skill at 7½*d.* per hour. Several hundred men are out.

**The Master Builders of Bradford** have decided to advance the wages of masons at Bradford to 7½*d.* per hour, thus terminating a strike which has lasted nearly three weeks. Operations have been resumed on several large buildings in course of erection; but as a large proportion of the masons of the town have obtained employment in Lancashire and elsewhere, there was not a general resumption of work.

**The Master Plumbers of New York**, on Monday, locked out 1,200 journeymen in order to compel the Plumbers' Trade Union to recognise the right of employers to control their workmen.

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JUNE 28, 1884.

### TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."

### COMPETITIONS OPEN.

**BURNLEY.**—July 1.—Plans are required for the Erection of Municipal Buildings, Police Courts, and Baths. Premiums of 200, 100, and 50 guineas. Mr. J. E. Stafford C.E., Borough Engineer, Burnley.

### CONTRACTS OPEN.

**BARTON.**—July 1.—For Rebuilding Bridge. Mr. W. Radford, Bridgemaster, 1 Princess Street, Manchester.

**BLAENAVON.**—June 30.—For Building Chapel. Mr. S. Barwell, William Street, Blaenavon.

**BOURNEMOUTH.**—June 28.—For Erection of Sanitary Hospital and Buildings and Works in connection, Iron Fencing, Sewers, &c. Mr. G. R. Andrews, Surveyor, Town Hall Chambers, Bournemouth.

**BRIGHOUSE.**—June 30.—For Building Chapel. Mr. John Judson, Architect, Bogthorn, Kelghley.

**BROMSGHVE.**—July 8.—For Building Infirmary at the Workhouse. Mr. C. A. Edge, Architect, 21 Bennett's Hill, Birmingham.

**EARLSDON.**—June 30.—For Additions to Inn. Mr. T. W. Whitley, Architect, Bank Chambers, High Street, Coventry.

**GREAT YARMOUTH.**—June 30.—For Building Class-room to School. Messrs. Bottle & Olley, Architects, Regent Street, Great Yarmouth.

**HALIFAX.**—July 5.—For Building Residence, Stabling, Coachhouse, &c. Messrs. Horsfall & Williams, Architects, Post-Office Buildings, Halifax.

**HAVERFORDWEST.**—July 9.—For Restoration of North Aisle and North Clerestory of St. Mary's Church. Mr. Ewan Christian, Architect, 8A Whitehall Place.

**HAWICK.**—June 28.—For Building Municipal Buildings. Mr. J. C. Walker, 2 N.E. Circus Place, Edinburgh.

**HOGGESTON.**—June 30.—For New Buildings and Repairs on Mayne's Hill Farm. Mr. J. T. Lawrence, Architect, Bridge Street, Leighton Buzzard.

**MILLOM.**—July 5.—For Building Three Shops and large Hall. Mr. T. B. Lillywhite, Architect, Market Square, Milloom.

**NEWMARKET.**—June 28.—For Building House, Cottage, Meter-house, &c. Mr. John Flatman, Architect, Kingston Villa, Station Road, Newmarket.

**PARK STREET, HERTS.**—July 1.—For Building Bridge. Mr. Urban A. Smith, County Surveyor, Hertford.

**PILING.**—July 2.—For Building Church. Mr. W. Wright, Surveyor, Lancaster.

**PRESTON.**—July 2.—For Building Presbyterian Church. Mr. Joseph Harding, 49 Lane Street, Preston.

**RAYDON.**—June 30.—For Building School. Messrs. T. H. & F. Healy, Architects, Tyrral Street, Bradford.

**SAMTHORPE.**—July 10.—For Building Cemetery Chapel, Mortuary, Lodge, Entrance Gates, and Pallsading. Mr. Robert Clamp, 5 Land of Green Ginger, Hull.

**SAWREY.**—June 30.—For the Erection of Villa Residence. Mr. Eli Cox, Architect, 22A Highgate, Kendal.

**WIGAN.**—July 2.—For Erection of a New Post Office. Mr. A. B. Milford, H.M.'s Office of Works, London.

### TENDERS.

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stove front. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

## TESTIMONIALS.

"9 Queen Victoria Chambers, Westminster, S.W.  
"June 10, 1884.  
"SIR,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it.  
"Yours, &c.  
"JAMES WEIR, F.R.I.B.A.

"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square.  
"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire-Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City  
Road, London.

Works—TYLDESLEY, near MANCHESTER.

# LINDSAY'S

## IMPROVED PATENT REVERSIBLE TREADS & LANDINGS

### FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

In Hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, not leaving any cracks, so that the treads or landings can be swept or washed quite clean; also, if it be necessary to get light under a Staircase or Landing, rough glass blocks can be fitted in the Iron frames, side by side with the wood, and a subdued light thus obtained.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works,
